## Looking For The Frontier A Search For Value:

**Heuristic Search** Stefan Edelkamp, Stefan Schroedl, 2011-05-31 Search has been vital to artificial intelligence from the very beginning as a core technique in problem solving. The authors present a thorough overview of heuristic search with a balance of discussion between theoretical analysis and efficient implementation and application to real world problems. Current developments in search such as pattern databases and search with efficient use of external memory and parallel processing units on main boards and graphics cards are detailed. Heuristic search as a problem solving tool is demonstrated in applications for puzzle solving, game playing, constraint satisfaction and machine learning. While no previous familiarity with heuristic search is necessary, the reader should have a basic knowledge of algorithms, data structures and calculus. Real world case studies and chapter ending exercises help to create a full and realized picture of how search fits into the world of artificial intelligence and the one around us. Provides real world success stories and case studies for heuristic search algorithms. Includes many AI developments not yet covered in textbooks such as pattern databases, symbolic search and parallel processing units. *Algorithms and Theory of Computation Handbook* Mikhail J. Atallah, 1998-11-23 *Algorithms and Theory of Computation Handbook* is a comprehensive collection of algorithms and data structures that also covers many theoretical issues. It offers a balanced perspective that reflects the needs of practitioners, including emphasis on applications within discussions on theoretical issues. Chapters include information on finite precision issues as well as discussion of specific algorithms where algorithmic techniques are of special importance, including graph drawing, robotics, forming a VLSI chip, vision and image processing, data compression and cryptography. The book also presents some advanced topics in combinatorial optimization and parallel distributed computing. Areas where algorithms and data structuring techniques are of special importance: graph drawing, robot algorithms, VLSI layout, vision and image processing algorithms, scheduling, electronic cash, data compression, dynamic graph algorithms, on-line algorithms, multidimensional data structures, cryptography, advanced topics in combinatorial optimization and parallel distributed computing. **Automated Planning and Acting** Malik Ghallab, Dana Nau, Paolo Traverso, 2016-08-09 Autonomous AI systems need complex computational techniques for planning and performing actions. Planning and acting require significant deliberation because an intelligent system must coordinate and integrate these activities in order to act effectively in the real world. This book presents a comprehensive paradigm of planning and acting using the most recent and advanced automated planning techniques. It explains the computational deliberation capabilities that allow an actor, whether physical or virtual, to reason about its actions, choose them, organize them purposefully and act deliberately to achieve an objective. Useful for students, practitioners and researchers, this book covers state of the art planning techniques, acting techniques and their integration, which will allow readers to design intelligent systems that are able to act effectively in the real world. **Visual Perception for Humanoid Robots** David Israel González Aguirre, 2018-09-01 This book provides an overview of model based environmental visual

perception for humanoid robots The visual perception of a humanoid robot creates a bidirectional bridge connecting sensor signals with internal representations of environmental objects The objective of such perception systems is to answer two fundamental questions What where is it To answer these questions using a sensor to representation bridge coordinated processes are conducted to extract and exploit cues matching robot s mental representations to physical entities These include sensor actuator modeling calibration filtering and feature extraction for state estimation This book discusses the following topics in depth Active Sensing Robust probabilistic methods for optimal high dynamic range image acquisition are suitable for use with inexpensive cameras This enables ideal sensing in arbitrary environmental conditions encountered in human centric spaces The book quantitatively shows the importance of equipping robots with dependable visual sensing Feature Extraction Recognition Parameter free edge extraction methods based on structural graphs enable the representation of geometric primitives effectively and efficiently This is done by eccentricity segmentation providing excellent recognition even on noisy low resolution images Stereoscopic vision Euclidean metric and graph shape descriptors are shown to be powerful mechanisms for difficult recognition tasks Global Self Localization Depth Uncertainty Learning Simultaneous feature matching for global localization and 6D self pose estimation are addressed by a novel geometric and probabilistic concept using intersection of Gaussian spheres The path from intuition to the closed form optimal solution determining the robot location is described including a supervised learning method for uncertainty depth modeling based on extensive ground truth training data from a motion capture system The methods and experiments are presented in self contained chapters with comparisons and the state of the art The algorithms were implemented and empirically evaluated on two humanoid robots ARMAR III A B The excellent robustness performance and derived results received an award at the IEEE conference on humanoid robots and the contributions have been utilized for numerous visual manipulation tasks with demonstration at distinguished venues such as ICRA CeBIT IAS and Automatica
