Non-Invasive Characterization of Liver Disease Markus Karlsson,2019-12-13 There is a large and unmet need for diagnostic tool that can be used to characterize chronic liver diseases CLD In the earlier stages of CLD much of the diagnostics involves performing biopsies which are evaluated by a histopathologist for the presence of e g fat iron inflammation and fibrosis Performing biopsies however have two downsides i biopsies are invasive and carries a small but non negligible risk for serious complications ii biopsies only represents a tiny portion of the liver and are thus prone to sampling error Moreover in the later stages of CLD when the disease has progressed far enough the ability of the liver to perform its basic function will be compromised In this stage there is a need for better methods for accurately measuring liver function Additionally measures of liver function can also be used when developing new drugs as biomarkers for drug induced liver injury DILI which is a serious drug safety issue Magnetic resonance imaging MRI is a non invasive medical imaging modality which have shown much promise with regards to characterizing liver disease in all of the abovementioned aspects

The aim of this PhD project was to develop and validate MR based methods that can be used to non invasively characterize liver disease Paper I investigated if R2 mapping a MR method for measuring liver iron content can be confounded by liver fat The results show fat does affect R2 The conclusion was therefore that fat must be taken into account when measuring small amounts of liver iron as a small increase in R2 could be due to either small amounts of iron or large amounts of fat Paper II examined whether T1 mapping which is another MR method can be used for staging liver fibrosis The results of previous research have been mixed some studies have been very promising whereas other studies have been less promising Unfortunately the results in Paper II belongs to the less promising studies Paper III focused on measuring liver function by dynamic contrast enhanced MRI DCEMRI using a liver specific contrast agent which is taken up the hepatocytes and excreted to the bile The purpose of the paper was to extend and validate a method for estimating uptake and efflux rates of the contrast agent The method had previously only been applied in health volunteers Paper II showed that the method can be applied to CLD patients and that the uptake of the contrast agent is lower in patients with advanced fibrosis Paper IV also used studied liver function with DCE MRI in patients with primary sclerosing cholangitis PSC PSC is a CLD where the bile ducts are attacked by the immune system When diagnosing PSC patients it is common to use magnetic resonance cholangiopancreatography MRCP which is a method for imaging the bile ducts Paper IV examined if there was any correlation between number and severity of the morphological changes seen on MRCP and measures of liver function derived using DCE MRI However the results showed no such correlation The conclusion was that the results indicates that MRCP should not be used to predict parenchymal function Paper V developed a method for translating DCE MRI liver function parameters from rats to humans This translation could be of value when developing new drugs as a tool for predicting which drugs might cause drug induced liver injury In summary this thesis has shown that multimodal quantitative MR has a bright future for characterizing liver disease from a range of different aspects

Advanced Quantitative Indexes in Cardiovascular Magnetic Resonance Imaging Xiaoyue Zhou,Rob J. Van Der Geest,Yucheng Chen,Peng Hu, Ming Yen Ng,2024-08-28 In the past decades advanced quantitative indexes obtained by cardiovascular magnetic resonance imaging CMRI such as myocardial strain myocardial T1 ECV T2 T2 relaxation value myocardial blood flow quantification index and hemodynamics indexes have been proposed as an alternative for non invasive quantitative evaluation in various cardiovascular diseases Those quantitative indexes have been proven to be more sensitive

in assessing the early change of myocardial tissue ventricular function or hemodynamics compared to the conventional qualitative methods. However, there are many challenges in the accurate measurement of those indexes as well as the evaluation of their clinical significance in the diagnosis and prognosis of a certain disease. Besides quality control and standardization of those indexes become crucial when promoting them into clinical practice. This Research Topic will offer comprehensive reviews and original research articles of the newly emerged quantitative CMRI methods and the clinical insights of the diagnostic and prognostic value of those advanced CMRI indexes. CMRI techniques such as myocardial strain analysis, quantitative myocardial tissue mapping, 2 dimensional, 4 dimensional flow quantification and quantitative perfusion will be of our interest. The aim of this Research Topic will be to highlight the promising technical improvements in the accurate measurement of the CMRI indexes and or the added value of those indexes in disease diagnosis and prognosis. Meanwhile, quality control and standardization of the advanced CMRI indexes in multi centre multi vendor research projects will be discussed.

Nonalcoholic Fatty Liver Disease Emad Hamdy Gad, 2019-11-20 Non alcoholic fatty liver disease NAFLD is a major medical challenge because of its increasing prevalence, difficulties in diagnosis, complex pathogenesis and lack of approved therapies. In the near future it will become the major form of chronic liver disease in adults and children and the leading indication for liver transplantation. It can be detected by noninvasive and invasive tools and its treatment depends mainly on lifestyle modification to prevent disease progression and its related sequelae. This book provides information on NAFLD prevalence, etiology, pathogenesis, pathology, diagnosis and treatment. Chapters cover such topics as experimental work related to the disease, other diseases related to NAFLD and noninvasive tools for diagnosis.

Non-Alcoholic Fatty Liver Disease Patrik Nasr, 2019-09-25 Non alcoholic fatty liver disease NAFLD is the most common cause of chronic liver disease affecting approximately 25% of the global population and is commonly recognized as the hepatic manifestation of the metabolic syndrome. The histological spectrum of NAFLD ranges from isolated steatosis to non alcoholic steatohepatitis NASH with risk of developing fibrosis and subsequent cirrhosis and hepatocellular carcinoma. The gold standard for diagnosing NAFLD is liver biopsy. However, because of its invasive nature, several non invasive methods have been developed and validated in evaluating fat and fibrosis in patients with NAFLD. Liver fat content can be assessed using various methods. The conventional histopathological method consists of a visual semiquantitative approach in which the pathologist uses a four point scale. Grade 0 corresponds to fat deposition in
