

characters, descriptions, color, size, developmental stages, habits, relation to man, abundance, range, details of occurrence in the western Atlantic, synonyms, and references. On pages 187-194, Merriam, Olsen, Wheatland, and Calhoun record the life-history and habits of *Raja erinacea*.

Those who use part two will be amazed to find 1388 footnotes on 562 pages. This distracts the reader who must search for the footnotes; at least 80 percent of this material would be better included in the text.

This book includes 27 genera and 67 species, which make a total of 66 genera and 137 species for the two big volumes. On the basis of an estimate of 1000 fish species in the "western North Atlantic," the present rate of completion of this project will occupy the indefinite future, with a minimum of 13 more volumes. The editorial board may need to alter present plans sufficiently to expedite the completion of this important undertaking in a reasonable length of time.

Some ichthyologists may question the authors' concept of a species in parts one and two, since in those few cases where many specimens were available, a statistical appraisal of morphologic characters used in distinguishing closely related forms is lacking. This cannot be considered as a too serious weakness in the first two volumes, for where large fishes are involved, such as sharks and rays, only a few specimens of a species, sometimes only a single specimen, are preserved in museums. Whereas, when small species of bony fishes are involved usually extensive series from numerous localities are available for statistical studies.

However, those who use part two may have complete confidence in this work. The classification and nomenclature are conservative, and the drawings were expertly prepared. The discussions, descriptions, and conclusions were written with mature judgment and are presented with deliberate and painstaking care.

Feeding Poultry. Gustave F. Heuser, Wiley, New York; Chapman and Hall, London, ed. 2, 1955. viii+632 pp. Illus. \$7.50.

In this edition the author has provided an almost new textbook in that it has been nearly rewritten. It brings together the practices of feeding and the science of poultry nutrition.

On the whole, the book is well organized and clearly written. It begins with the feeding problem and the objectives in poultry feeding, then moves on to a discussion of the nutrients and ingredi-

ents used, the essential factors in a poultry diet, and systems and practices of feeding. The last part deals with the feeding of chickens for specific functions and the feeding of turkeys, waterfowl, and other species of birds. A number of recommended rations is included in the appendix.

Although no attempt is made to include all the poultry nutrition studies reported in the literature, an extensive list of references is given at the ends of the chapters for the interest of those who wish additional information. The author has attempted to evaluate contradictory information, thus saving the reader the time and effort of interpretation.

Heuser states that the book is designed to meet the needs of poultry students, practical poultrymen, feed dealers, and others interested in poultry feeding. Since he has emphasized the practical more than the technical phases, he has accomplished his objective.

Linear Equations in Applied Mechanics. H. F. P. Purday. Oliver & Boyd, Edinburgh-London; Interscience New York, 1954. xiv + 240 pp. Illus. \$3.50.

Much of the mathematical structure underlying the physical theories that the engineer deals with in the fields of mechanical vibrations, flow of fluids, heat, electricity, automation, and so forth, is linear analysis. The common structure of linear algebraic equations and functional equations of various kinds has been recognized and exploited for a long time.

According to the author's preface, "The object of this book is to help readers with an elementary knowledge of the calculus to get acquainted with the easier aspects of linear algebraic equations, difference equations, ordinary and partial differential equations, and integral equations as well as the associated ideas of matrices, determinants, invariants, vectors, tensors, conjugate functions, orthogonal functions, series, etc." This is a very worth-while undertaking, and the book is the more valuable because it includes an account of the more elementary methods of solution by numerical, mechanical, and electric means of computation. A good deal of numerical work applied to actual engineering problems is given in full.

No attempt is made at mathematical rigor, and mathematical proofs are almost entirely absent. This is as it should be in a book of this kind. On the other hand, one would expect that strict mathematical reasoning would be replaced by appeal to intuition, by emphasis on anal-

ogies, and by extensive motivation of the procedures described. However, there is very little of this in the book. Tensors are introduced as quantities that transform according to a certain rule, but why this rule is chosen and no other is nowhere explained. The product of matrices is defined as an arbitrary convention with no mention of the fact that it follows logically from the result of successive linear substitutions.

The unifying concept of all linear analysis, that of linear transformation, is not discussed at all, and the term linear operator is not even mentioned. Matrices are employed only for convenience of notation, with no allusion to their operational aspect. Because of this lack of logical integration and motivation, the book has the character of a technical manual. One also questions the didactic value of its organization. The elementary arithmetic of complex numbers is taken up in some detail close to the end, with a two-page treatment of integral transforms including Laplace's following a few pages later and a few brief paragraphs on the theory of linear integral equations at the end.

These two volumes by the well-known professor of cosmic physics at the University of France have as their object "to present succinctly what is known about cosmic magnetic phenomena and attempt to coordinate it . . . to try to bring some clarity into a little known and very controversial subject." In accomplishing the first of these three objectives, the author is fairly successful, and consequently the two volumes serve a useful purpose for those who would like a summary of some of the literature in this field during the past few decades. Although the books are written in French, the style and language employed present little difficulty for an English reader who has a limited ability with that language.

The subject matter covers a very wide range. The first volume begins with an excellent presentation of the Störmer theory of the motion of high-energy charged particles in the field of a magnetic dipole and continues with discussions of the magnetic fields of the sun and stars, of the solar corona, and of the
