Haar Romeny,2008-10-24 Many approaches have been proposed to solve the problem of finding the optic flow field of an image sequence Three major classes of optic flow computation techniques can discriminated see for a good overview Beauchemin and Barron IBeauchemin19951 gradient based or differential methods phase based or frequency domain methods correlation based or area methods feature point or sparse data tracking methods In this chapter we compute the optic flow as a dense optic flow field with a multi scale differential method The method originally proposed by Florack and Nielsen Florack1998a is known as the Multiscale Optic Flow Constrain Equation MOFCE This is a scale space version of the well known computer vision implementation of the optic flow constraint equation as originally proposed by Horn and Schunck Horn1981 This scale space variation as usual consists of the introduction of the aperture of the observation in the process The application to stereo has been described by Maas et al Maas 1995a Maas 1996a Of course difficulties arise when structure emerges or disappears such as with occlusion cloud formation etc Then knowledge is needed about the processes and objects involved In this chapter we focus on the scale space approach to the local measurement of optic flow as we may expect the visual front end to do 17 2 Motion detection with pairs of receptive fields As a biologically motivated start we begin with discussing some neurophysiological findings in the visual system with respect to motion detection
