**The Transport of Chemically Reacting Species in the Classical Capillary** John T. Howe, 1963 Intellectual Pursuits of Nicolas Rashevsky Maya M. Shmailov, 2016-08-29 Who was Nicolas Rashevsky To answer that question this book draws on Rashevsky's unexplored personal archival papers and shares interviews with his family students and friends as well as discussions with biologists and mathematical biologists to flesh out and complete the picture Most modern day biologists have never heard of Rashevsky Why In what constitutes the first detailed biography of theoretical physicist Nicolas Rashevsky 1899 1972 spanning key aspects of his long scientific career the book captures Rashevsky's ways of thinking about the place mathematical biology should have in biology and his personal struggle for the acceptance of his views It brings to light the tension between mathematicians theoretical physicists and biologists when it comes to the introduction of physico mathematical tools into biology Rashevsky's successes and failures in his efforts to establish mathematical biology as a subfield of biology provide an important test case for understanding the role of theory in particular mathematics in understanding the natural world With the biological sciences moving towards new vistas of inter and multi disciplinary collaborations and research programs the book will appeal to a wide readership ranging from historians sociologists and ethnographers of American science and culture to students and general readers with an interest in the history of the life sciences mathematical biology and the social construction of science *NASA Technical Note*, 1963 *The Principles of Psychology* William James, 1918 **The Central Nervous System of Vertebrates, Vol.**

Bedau,Liaohai Chen,David Deamer,David C. Krakauer,2022-06-07 The first comprehensive general resource on state of the art protocell research describing current approaches to making new forms of life from scratch in the laboratory Protocells offers a comprehensive resource on current attempts to create simple forms of life from scratch in the laboratory These minimal versions of cells known as protocells are entities with lifelike properties created from nonliving materials and the book provides in depth investigations of processes at the interface between nonliving and living matter Chapters by experts in the field put this state of the art research in the context of theory laboratory work and computer simulations on the components and properties of protocells The book also provides perspectives on research in related areas and such broader societal issues as commercial applications and ethical considerations The book covers all major scientific approaches to creating minimal life both in the laboratory and in simulation It emphasizes the bottom up view of physicists chemists and material scientists but also includes the molecular biologists top down approach and the origin of life perspective The capacity to engineer living technology could have an enormous socioeconomic impact and could bring both good and ill Protocells promises to be the essential reference for research on bottom up assembly of life and living technology for years to come It is written to be both resource and inspiration for scientists working in this exciting and important field and a definitive text for the interested layman      Problems in Mathematical Biophysics Alberto d'Onofrio,Antonio Fasano,Federico Papa,Carmela Sinisgalli,2024-08-09 The book Problems in Mathematical Biophysics a volume in memory of Alberto Gandolfi aims at reviewing the current state of the art of the mathematical approach to various areas of theoretical biophysics Leading authors in the field have been invited to contribute having a strong appreciation of Alberto Gandolfi as a scientist and as a man and sharing his same passion for biology and medicine as well as his style of investigation Encompassing both theoretical and practical aspects of Mathematical Biophysics the topics covered in this book span a spectrum of different problems in biology and medicine including population dynamics tumor growth and control immunology epidemiology ecology and others As a result the book offers a comprehensive and current overview of compelling subjects and challenges within the realm of mathematical biophysics In their contributions the authors have effectively conveyed not only their research findings but also their peculiar perspective and approach to problem solving dealing with oncology epidemiology neuro sciences and biochemistry The chapters pertain to a wide array of mathematical areas such as continuous Markov chains partial differential equations kinetic theory applied statistical mechanics noise

Bergethon, 2013-03-14 The objective of this book is to provide a unifying approach to the study of biophysical chemistry for the advanced undergraduate who has had a year of physics organic chemistry calculus and biology This book began as a revised edition of Biophysical Chemistry Molecules to Membranes which Elizabeth Simons and I coauthored That short volume was written in an attempt to provide a concise text for a one semester course in biophysical chemistry at the graduate level The experience of teaching biophysical chemistry to biologically oriented students over the last decade has made it clear that the subject requires a more fundamental text that unifies the many threads of modern science physics chemistry biology mathematics and statistics This book represents that effort This volume is not a treatment of modern biophysical chemistry with its rich history and many controversies although a book on that topic is also needed The Physical Basis of Biochemistry is an introduction to the philosophy and practice of an interdisciplinary field in which biological systems are explored using the quantitative perspective of the physical scientist I have three primary objectives in this volume one to provide a unifying picture of the interdisciplinary threads from which the tapestry of biophysical studies is woven two to provide an insight into the power of the modeling approach to scientific investigation and three to communicate a sense of excitement for the activity and wholesome argument that characterize this field of study      **The Central Nervous System of Vertebrates, Vol. 3/I** H. Kuhlenbeck, 1970-05-27 In 1927 Hartwig Kuhlenbeck published a series of lectures on the central nervous system of vertebrates and gave neurobiology its standard reference for decades The present work now complete in 5 volumes represents a monumental expansion of the early lectures      **Learning and Physiological Regulation** Barry R. Dworkin, 1993-03-15 Since Pavlov physiologists have explained homeostasis the regulation of bodily functions as the action of fixed negative feedback networks within individual organ systems However these standard explanations largely ignore the mechanisms of conditioning and learning Drawing on the work of Western East European and Russian physiologists Barry R Dworkin challenges traditional concepts and argues that learning mechanisms of the nervous system are essential to regulation Dworkin shows how through experience learning mechanisms determine dynamic stability and the long term regulation of heart rate blood pressure glucose electrolytes and temperature He argues that hard wired mechanisms do not adequately account for the speed and accuracy of physiological adjustments and supports his contention with detailed analyses and mathematical models of how conditioned and unconditioned reflexes interact Dworkin reviews a wealth of research on interoceptive conditioning conditioned drug responses and visceral adjustment Combining

physiological and behavioral data with mathematical analysis and computer models he synthesizes the work of Pavlov and W B Cannon in a quantitative theory of physiological regulation that will interest researchers and theorists in medicine physiology neuroscience and biopsychology      *Continuous and Distributed Systems II* Viktor A. Sadovnichiy, Mikhail Z. Zgurovsky, 2015-06-04 As in the previous volume on the topic the authors close the gap between abstract mathematical approaches such as applied methods of modern algebra and analysis fundamental and computational mechanics nonautonomous and stochastic dynamical systems on the one hand and practical applications in nonlinear mechanics optimization decision making theory and control theory on the other Readers will also benefit from the presentation of modern mathematical modeling methods for the numerical solution of complicated engineering problems in biochemistry geophysics biology and climatology This compilation will be of interest to mathematicians and engineers working at the interface of these fields It presents selected works of the joint seminar series of Lomonosov Moscow State University and the Institute for Applied System Analysis at National Technical University of Ukraine Kyiv Polytechnic Institute The authors come from Brazil Germany France Mexico Spain Poland Russia Ukraine and the USA
