Asymptotic Geometric Analysis, Part II Shiri Artstein-Avidan, Apostolos Giannopoulos, Vitali D. Milman, 2021-12-13 This book is a continuation of Asymptotic Geometric Analysis Part I which was published as volume 202 in this series Asymptotic geometric analysis studies properties of geometric objects such as normed spaces convex bodies or convex functions when the dimensions of these objects increase to infinity The asymptotic approach reveals many very novel phenomena which influence other fields in mathematics especially where a large data set is of main concern or a number of parameters which becomes uncontrollably large One of the important features of this new theory is in developing tools which allow studying high parametric families Among the topics covered in the book are measure concentration isoperimetric constants of log concave measures thin shell estimates stochastic localization the geometry of Gaussian measures volume inequalities for convex bodies local theory of Banach spaces type and cotype the Banach Mazur compactum symmetrizations restricted invertibility and functional versions of geometric notions and inequalities [Proceedings of the International Congress of Mathematicians](#) Rajendra Bhatia, Arup Pal, 2010 ICM 2010 proceedings comprise a four volume set containing articles based on plenary lectures and invited section lectures the Abel and Noether lectures as well as contributions based on lectures delivered by the recipients of the Fields Medal the Nevanlinna and Chern Prizes The first volume will also contain the speeches at the opening and closing ceremonies and other highlights of the Congress [Evolution Equations of Hyperbolic and Schrödinger Type](#) Michael Ruzhansky, Mitsuru Sugimoto, Jens Wirth, 2012-08-04 Evolution equations of hyperbolic or more general p evolution type form an active field of current research This volume aims to collect some recent

advances in the area in order to allow a quick overview of ongoing research The contributors are first rate mathematicians This collection of research papers is centred around parametrix constructions and microlocal analysis asymptotic constructions of solutions energy and dispersive estimates and associated spectral transforms Applications concerning elasticity and general relativity complement the volume The book gives an overview of a variety of ongoing current research in the field and therefore allows researchers as well as students to grasp new aspects and broaden their understanding of the area

Partial Differential Equations and the Calculus of Variations COLOMBINI,MARINO,MODICA,SPAGNOLA,2013-11-11

The Italian school of Mathematical Analysis has long and glorious traditions In the last thirty years it owes very much to the scientific pre eminence of Ennio De Giorgi Professor of Mathematical Analysis at the Scuola Normale Superiore di Pisa His fundamental theorems in Calculus of Variations in Minimal Surfaces Theory in Partial Differential Equations in Axiomatic Set Theory as well as the fertility of his mind to discover both general mathematical structures and techniques which frame many different problems and profound and meaningful examples which show the limits of a theory and give origin to new results and theories makes him an absolute reference point for all Italian mathematicians and a well known and valued personage in the international mathematical world We have been students of Ennio de Giorgi Now we are glad to present to him together with all his colleagues friends and former students these Essays of Mathematical Analysis written in his honour on the occasion of his sixtieth birthday February 8th 1988 with our best wishes and our thanks for all he gave in the past and will give us in the future We have added to the research papers of this book the text of a conversation with Ennio De Giorgi about the diffusion and the communication of science and in particular of Mathematics

Lectures on the Energy Critical Nonlinear Wave Equation Carlos E. Kenig,2015-04-14 This monograph deals with recent advances in the study of the long time asymptotics of large solutions to critical nonlinear dispersive equations The first part of the monograph describes in the context of the energy critical wave equation the concentration compactness rigidity theorem method introduced by C Kenig and F Merle This approach has become the canonical method for the study of the global regularity and well posedness conjecture defocusing case and the ground state conjecture focusing case in critical dispersive problems The second part of the monograph describes the channel of energy method introduced by T Duyckaerts C Kenig and F Merle to study soliton resolution for nonlinear wave equations This culminates in a presentation of the proof of the soliton resolution conjecture for the three dimensional radial focusing energy critical wave equation It is the intent that the results described in this book will be a model for what to strive for in the study of other nonlinear dispersive equations A co publication of the AMS and CBMS

Nonlinear Diffusion Equations and Their Equilibrium States I W.-M. Ni, L.A. Peletier, James Serrin, 2012-12-06 In recent years considerable interest has been focused on nonlinear diffusion problems the archetypical equation for these being $U_t = D(u)f(u)$ Here D denotes the n dimensional Laplacian the solution $u(x,t)$ is defined over some space time domain of the form $n \times [0, T]$ and $f(u)$ is a given real function whose form is determined by various physical and mathematical applications These applications have become more varied and widespread as problem after problem has been shown to lead to an equation of this type or to its time independent counterpart the elliptic equation of equilibrium $D(u)f(u) = 0$ Particular cases arise for example in population genetics the physics of nuclear stability phase transitions between liquids and gases flows in porous media the Lend Emden equation of astrophysics various simplified combustion models and in determining metrics which realize given scalar or Gaussian curvatures In the latter direction for example the problem of finding conformal metrics with prescribed curvature leads to a ground state problem involving critical exponents Thus not only analysts but geometers as well can find common ground in the present work The corresponding mathematical problem is to determine how the structure of the nonlinear function $f(u)$ influences the behavior of the solution

Fundamental Solutions of Linear Partial Differential Operators Norbert Ortner, Peter Wagner, 2015-08-05 This monograph provides the theoretical foundations needed for the construction of fundamental solutions and fundamental matrices of systems of linear partial differential equations Many illustrative examples also show techniques for finding such solutions in terms of integrals Particular attention is given to developing the fundamentals of distribution theory accompanied by calculations of fundamental solutions The main part of the book deals with existence theorems and uniqueness criteria the method of parameter integration the investigation of quasihyperbolic systems by means of Fourier and Laplace transforms and the representation of fundamental solutions of homogeneous elliptic operators with the help of Abelian integrals In addition to rigorous distributional derivations and verifications of fundamental solutions the book also shows how to construct fundamental solutions matrices of many physically relevant operators systems in elasticity thermoelasticity hexagonal cubic elastodynamics for Maxwell's system and others The book mainly addresses researchers and lecturers who work with partial differential equations However it also offers a valuable

resource for students with a solid background in vector calculus complex analysis and functional analysis

Introduction to the Perturbation Theory of Hamiltonian Systems Dmitry Treschev, Oleg Zubelevich, 2009-10-08 This book is an extended version of lectures given by the first author in 1995-1996 at the Department of Mechanics and Mathematics of Moscow State University We believe that a major part of the book can be regarded as an additional material to the standard course of Hamiltonian mechanics In comparison with the original Russian 1st version we have included new material simplified some proofs and corrected misprints Hamiltonian equations first appeared in connection with problems of geometric optics and celestial mechanics Later it became clear that these equations describe a large class of systems in classical mechanics physics chemistry and other domains Hamiltonian systems and their discrete analogs play a basic role in such problems as rigid body dynamics geodesics on Riemann surfaces quasi-classic approximation in quantum mechanics cosmological models dynamics of particles in an accelerator billiards and other systems with elastic reflections many infinite dimensional models in mathematical physics etc In this book we study Hamiltonian systems assuming that they depend on some parameter usually where for 0 the dynamics is in a sense simple as a rule integrable Frequently such a parameter appears naturally For example in celestial mechanics it is accepted to take equal to the ratio the mass of Jupiter over the mass of the Sun In other cases it is possible to introduce the small parameter artificially
