Batty,Frank Neubrander,2013-11-11 Linear evolution equations in Banach spaces have seen important developments in the last two decades This is due to the many different applications in the theory of partial differential equations probability theory mathematical physics and other areas and also to the development of new techniques One important technique is given by the Laplace transform It played an important role in the early development of semigroup theory as can be seen in the pioneering monograph by Rille and Phillips HP57 But many new results and concepts have come from Laplace transform techniques in the last 15 years In contrast to the classical theory one particular feature of this method is that functions with values in a Banach space have to be considered The aim of this book is to present the theory of linear evolution equations in a systematic way by using the methods of vector valued Laplace transforms It is simple to describe the basic idea relating these two subjects Let A be a closed linear operator on a Banach space X The Cauchy problern defined by A is the initial value problern t 2 0 CP u t Au t u O x where x E X is a given initial value If u is an exponentially bounded continuous function then we may consider the Laplace transform 00 u 1 e tu t dt of u for large real **Functional Analysis and Evolution Equations** Herbert Amann,Wolfgang Arendt,Frank Neubrander,Serge Nicaise,Joachim Below,2008-02-28 Gunter Lumer was an outstanding mathematician whose works have great influence on the research community in mathematical analysis and evolution equations He was at the origin of the breath taking development the theory of semigroups saw after the pioneering book of Hille and Phillips from 1957 This volume contains invited contributions presenting the state of the art of these topics and reflecting the broad interests of Gunter Lumer
