Particle Accelerator Physics II Nonlinear And Higherorder Beam Dynamics:

Particle Accelerator Physics II Helmut Wiedemann, 2012-12-06 This text is a continuation of the first volume of Particle Accelerator Physics on Basic Principles and Linear Beam Dynamics While the first volume was written as an introductory overview into beam dynamics it does not include more detailed discussion of nonlinear and higher order beam dynamics or the full theory of synchrotron radiation from relativistic electron beams Both issues are however of fundamental importance for the design of modern particle accelerators In this volume beam dynamics is formulated within the realm of Hamiltonian dynamics leading to the description of multiparticle beam dynamics with the Vlasov equation and including statistical processes with the Fokker Planck equation Higher order perturbations and aberrations are discussed in detail including Hamiltonian resonance theory and higher order beam dynamics The discussion of linear beam dynamics in Vol I is completed here with the derivation of the general equation of motion including kinematic terms and coupled motion To build on the theory of longitudinal motion in Vol I the interaction of a particle beam with the rf system including beam loading higher order phase focusing and the combination of acceleration and transverse focusing is discussed The emission of synchrotron radiation greatly affects the beam quality of electron or positron beams and we therefore derive the detailed theory of synchrotron radiation including spatial and spectral distribution as well as properties of polarization *Particle Accelerator Physics II* H. Wiedemann, 2012-12-06 Particle Accelerator Physics II continues the discussion of particle accelerator physics beyond the introductory Particle Accelerator Physics I Aimed at students and scientists who plan to work or are working in the field of accelerator physics Basic principles of beam dynamics already discussed in Vol I are expanded into the nonlinear regime in order to tackle fundamental problems encountered in present day accelerator design and development Nonlinear dynamics is discussed both for the transverse phase space to determine chromatic and geometric aberrations which limit the dynamic aperture as well as for the longitudinal phase space in connection with phase focusing at very small values of the momentum compaction Effects derived theoretically are compared with observations made at existing accelerators

Particle Accelerator Physics I Helmut Wiedemann, 2012-12-06 In this second edition of Particle Accelerator Physics Vol 1 is mainly a reprint of the first edition without significant changes in content The bibliography has been updated to include more recent progress in the field of particle accelerators With the help of many observant readers a number of misprints and errors could be eliminated The author would like to express his sincere appreciation to all those who have pointed out such shortcomings and welcome such information and any other relevant information in the future The author would also like to express his special thanks to the editor Dr Helmut Lotsch and his staff for editorial as well as technical advice and support which contributed greatly to the broad acceptance of this text and made a second edition of both volumes necessary Palo Alto California Helmut Wiedemann November 1998 VII Preface to the First Edition The purpose of this textbook is to provide a comprehensive introduction into the physics of particle accelerators and particle beam dynamics Particle accelerators have

become important research tools in high energy physics as well as sources of incoherent and coherent radiation from the far infra red to hard x rays for basic and applied research During years of teaching accelerator physics it became clear that the single most annoying obstacle to get introduced into the field is the absence of a suitable textbook

Beam-Wave Interaction in Periodic and Quasi-Periodic Structures Levi Schächter, 2013-03-09

During the past seven years I have been involved in the investigation of high power microwave sources for accelerator and radar applications As for many others before me the starting point of this book was a collection of notes on theoretical topics out of the material I had been working on The notes were the core of a course for graduate students at Cornell University When I started to prepare these notes it seemed a fairly straight forward and not very time consuming task since I had most of the material well organized Today three years after the preparation of the first notes I can only wonder how naive this thought was Most of my work was oriented towards analytic and quasi analytic techniques for the investigation of the interaction of an electron beam with electromagnetic waves These topics are presented in Chaps 4 and 6 However for a systematic elaboration of these topics it was necessary to provide some general background therefore parts of what are today Chaps 2 3 and 5 were prepared Related topics of acceleration concepts were also prepared to some extent but I ran out of time and the material Chap 8 was not delivered In the meantime various sections of this book were taught at the Technion Israel Institute of Technology and Ben Gurion University In the last version I included a discussion on free electron lasers Chap 7

Davidson, Qin Hong, 2001-10-22 *Physics of Intense Charged Particle Beams in High Energy Accelerators* is a graduate level

text complete with 75 assigned problems which covers a broad range of topics related to the fundamental properties of collective processes and nonlinear dynamics of intense charged particle beams in periodic focusing accelerators and transport systems. The subject matter is treated systematically from first principles using a unified theoretical approach and the emphasis is on the development of basic concepts that illustrate the underlying physical processes in circumstances where intense self fields play a major role in determining the evolution of the system. The theoretical analysis includes the full influence of dc space charge and intense self field effects on detailed equilibrium stability and transport properties and is valid over a wide range of system parameters ranging from moderate intensity moderate emittance beams to very high intensity low emittance beams. This is particularly important at the high beam intensities envisioned for present and next generation accelerators colliders and transport systems for high energy and nuclear physics applications and for heavy ion fusion. The statistical models used to describe the properties of intense charged particle beams are based on the Vlasov-Maxwell equations, the macroscopic fluid Maxwell equations or the Klimontovich Maxwell equations as appropriate and extensive use is made of theoretical techniques developed in the description of one component nonneutral plasmas and multispecies electrically neutral plasmas as well as established techniques in accelerator physics, classical mechanics, electrodynamics and statistical physics. *Physics of Intense Charged Particle Beams in High Energy Accelerators* emphasizes basic physics principles and the thorough presentation style is intended to have a lasting appeal to graduate students and researchers alike. Because of the advanced theoretical techniques developed for describing one component charged particle systems, a useful companion volume to this book is *Physics of Nonneutral Plasmas* by Ronald C Davidson a [Particle Accelerator Physics](#) Helmut Wiedemann, 2015-07-24. This book by Helmut Wiedemann is a well established classic text providing an in depth and comprehensive introduction to the field of high energy particle acceleration and beam dynamics. The present 4th edition has been significantly revised, updated and expanded. The newly conceived Part I is an elementary introduction to the subject matter for undergraduate students. Part II gathers the basic tools in preparation of a more advanced treatment summarizing the essentials of electrostatics and electrodynamics as well as of particle dynamics in electromagnetic fields. Part III is an extensive primer in beam dynamics followed in Part IV by an introduction and description of the main beam parameters and including a new chapter on beam emittance and lattice design. Part V is devoted to the treatment of perturbations in beam dynamics. Part VI then discusses the details of charged particle acceleration. Parts VII and VIII introduce the more advanced topics of coupled beam dynamics and describe very intense beams. A number of additional beam instabilities are introduced and reviewed in this new edition. Part IX is an exhaustive treatment of radiation from accelerated charges and introduces important sources of coherent radiation such as synchrotrons and free electron lasers. The appendices at the end of the book gather useful mathematical and physical formulae, parameters and units. Solutions to many end of chapter problems are given. This textbook is suitable for an intensive two semester course starting at the senior
