Polyolefin is a major industry that is important for our economy and impacts every aspect of our lives The discovery of new transition metal based catalysts is one of the driving forces for the further advancement of this field Whereas the classical heterogeneous Ziegler Natta catalysts and homogeneous early transition metal metallocene catalysts remain the workhorses of the polyolefin industry in roughly the last decade tremendous progress has been made in developing non metallocene based olefin polymerization catalysts Particularly the discovery of late transition metal based olefin polymerization catalysts heralds a new era for this field These late transition metal complexes not only exhibit high activities rivaling their early metal counterparts but more importantly they offer unique properties for polymer architectural control and copolymerization with polar olefins In this book the most recent major breakthroughs in the development of new olefin polymerization catalysts including early metal metallocene and non metallocene complexes and late transition metal complexes are discussed by leading experts The authors highlight the most important discoveries in catalysts and their applications in designing new polyolefin based functional materials **Applied Homogeneous Catalysis** Arno Behr,Peter Neubert,2012-04-16 Auf

Metallocene is a well known sandwich complex with two cyclopentadienyl ligands such as ferrocene. Recently such metallocene compounds have been found to be very characteristic and they have become very important not only in the area of organic synthesis but also in polymerization in industry. Metal complexes with one cyclopentadienyl ligand have also become popular as half sandwich complexes. The number of researchers in the field of metallocenes has increased rapidly. However, the origin of the characteristic reactivity of metallocenes is not fully understood. In this volume, the chemistry of metal complexes with at least one cyclopentadienyl ligand is comprehensively covered by leading experts. Reactions discussed here are: i) natural product synthesis, ii) catalytic asymmetric synthesis, iii) cyclization reactions, iv) catalytic reactions, v) polymerization reactions, and vi) carbon-carbon bond cleavage reactions. The reader will have access to useful information about the current state of metallocene chemistry. Theoretical Aspects of Transition Metal Catalysis Gernot

Frenking, 2005-06-23. Transition metal catalysis belongs to the most important chemical research areas because a ubiquitous number of chemical reactions are catalyzed by transition metal compounds. Many efforts are being made by industry and academia to find new and more efficient catalysts for chemical processes. Transition metals play a prominent role in catalytic research because they have been proven to show an enormous diversity in lowering the activation barrier for chemical reactions. For many years, the search for new catalysts was carried out by trial and error, which was costly and time consuming. The understanding of the mechanism of the catalytic process is often not very advanced because it is difficult to study the elementary steps of the catalysis with experimental techniques. The development of modern quantum chemical methods for calculating possible intermediates and transition states was a breakthrough in gaining an understanding of the reaction pathways of transition metal catalyzed reactions. This volume, organized into eight chapters written by leading scientists in the field, illustrates the progress made during the last decade. The reader will obtain a deep insight into the present state of quantum chemical research in transition metal catalysis. **New Aspects of Zirconium Containing**

Organic Compounds Ilan Marek, 2005-02-18. Metal carbene complexes have made their way from organometallic curiosities to valuable reagents and catalysts. They offer novel synthetic opportunities in carbon-carbon bond formation based on either carbene centered reactions or on metal templated processes, which makes them indispensable in modern synthetic methodology. The most prominent metal carbenes are now either commercially available or easy to synthesize and handle with modern laboratory techniques. This volume, organized in eight chapters written by the leading scientists in the field, illustrates the theoretical background, non-classical nucleophilic and cycloaddition patterns, chromium templated benzannulation, and photo-induced reactions, rhodium catalyzed carbene transfer, as well as the principles and applications of olefin metathesis, which has coined the progress in synthetic methodology over the past decade. Designed for researchers in academia and industry as well as graduate students, it presents the state of the art potential of carbene complexes in modern

Transition Metal Arene π -Complexes in Organic Synthesis and Catalysis Peter E. Kündig, 2004-09-03 Metal arene π complexes show a rich and varied chemistry The metal adds a third dimension to the planar aromatic compounds and coordination of a metal to an arene thus not only altering the reactivity of ring carbons and substituents but also makes possible reactions that lead to chiral non racemic products This book organized in nine chapters and written by leading scientists in the field provides the reader with an up to date treatise on the subject organized according to reaction type and use It covers the wide spectrum of arene activation from the electrophilic activation of h_6 bound arene by π Lewis acid metal complex fragments to reactions of nucleophilic h_2 coordinated arene complexes The preparation of complexes is detailed as are the scope limitations and challenges of reactions in contemporary π arene metal chemistry with special attention given to asymmetric transformations The emphasis of the book is on transformations of interest to organic synthesis and on the use of the complexes as catalysts or as chiral ligands The book is written for academic and industrial researchers in organic organometallic and inorganic chemistry as well as for advanced chemistry students **Bio-inspired Catalysts** Thomas R. Ward, 2009-02-19 In order to meet the ever increasing demands for enantiopure compounds heterogeneous homogeneous and enzymatic catalysis evolved independently in the past Although all three approaches have yielded industrially viable processes the latter two are the most widely used and can be regarded as complementary in many respects Despite the progress in structural computational and mechanistic studies however to date there is no universal recipe for the optimization of catalytic processes Thus a trial and error approach remains predominant in catalyst discovery and optimization With the aim of complementing the well established fields of homogeneous and enzymatic catalysis organocatalysis and artificial metalloenzymes have enjoyed a recent revival Artificial metalloenzymes which are the focus of this book result from combining an active but unselective organometallic moiety with a macromolecular host Kaiser and Whitesides suggested the possibility of creating artificial metallozymes as long ago as the late 1970s However there was a widespread belief that proteins and organometallic catalysts were incompatible with each other This severely hampered research in this area at the interface between homogeneous and enzymatic catalysis Since 2000 however there has been a growing interest in the field of artificial metalloenzymes for enantioselective catalysis The current state of the art and the potential for future development are presented in five well balanced chapters G Roelfes B Feringa et al summarize research relying on DNA as a macromolecular host for enantioselective catalysis Organic Syntheses, Collective Volume 12 Charles K.
