

When two magnets are brought close together, the magnetic field lines are perturbed, just as happens for electric field lines when two electric charges are brought together. Bringing two north poles together—or two south poles—will cause a repulsion, and the magnetic field lines will bend away from each other. This is shown in Figure a, which shows the magnetic field lines created by the two closely separated north poles of a bar magnet. When opposite poles of two magnets are brought together, the magnetic field lines join together and become denser between the poles. This situation is shown in Figure b

Like the electric field, the magnetic field is stronger where the lines are denser. Thus, between the two north poles in Figure a, the magnetic field is very weak because the density of the magnetic field is almost zero. A compass placed at that point would essentially spin freely if we ignore Earth's magnetic field. Conversely, the magnetic field lines between the north and south poles in Figure b are very dense, indicating that the magnetic field is very strong in this region. A compass placed here would quickly align with the magnetic field and point toward the south pole on the right.

(a) When two north poles are approached together, the magnetic field lines repel each other and the two magnets experience a repulsive force. The same occurs if two south poles are approached together. (b) If opposite poles are approached together, the magnetic field lines become denser between the poles and the magnets experience an attractive force.

Ware, 1851 [De Quibus](#) William Henry Taylor, 1908 [Aromaticity](#) Israel Fernandez, 2021-05-16 Evaluating the aromaticity of a molecular system and the influence of this concept on its properties is a crucial step in the development of novel aromatic systems. Modern computational methods can provide researchers with a high level of insight into such aromaticity, but identifying the most appropriate method for assessing a specific system can prove difficult. Aromaticity

Modern Computational Methods and Applications reviews the latest state of the art computational methods in this field and discusses their applicability for evaluating the aromaticity of a system. In addition to covering aromaticity for typical organic molecules, this volume also explores systems possessing transition metals in their structures, macrocycles, and even transition structures. The influence of the aromaticity on the properties of these species, including the structure, magnetic properties, and reactivity, is highlighted, along with potential applications in fields including materials science and medicinal chemistry. Finally, the controversial and fuzzy nature of aromaticity as a concept is discussed, providing the basis for an updated and more comprehensive definition of this concept. Drawing on the knowledge of an international team of experts, *Aromaticity: Modern Computational Methods and Applications* is a unique guide for anyone researching, studying, or applying principles of aromaticity in their work, from computational and organic chemists to pharmaceutical and materials scientists. It reviews a range of computational methods to assess the aromatic nature of different compounds, helping readers select the most useful tool for the system they are studying. It presents a complete guide to the key concepts and fundamental principles of aromaticity, provides guidance on identifying which variables should be modified to tune the properties of an aromatic system, and discusses different potential applications.

Whispering the Techniques of Language: An Mental Quest through **Magnetism And Exaltation**

In a digitally-driven world where displays reign supreme and instant interaction drowns out the subtleties of language, the profound secrets and mental nuances concealed within words usually go unheard.
