Materials Research Using Cold Neutrons At Pulsed Neutron Sources:

Materials Research Using Cold Neutrons At Pulsed Neutron Sources Chun Keung Loong, Pappannan Thiagarajan, F. Trouw, Beverly A. Marzec, 1999-04-29 The applications of the use of cold neutrons for condensed matter research at accelerator based spallation sources are less well known than that of the use of cold neutrons at reactor sources. This book represents the outcome of the first international workshop on Materials Research Using Cold Neutrons at Pulsed Sources. It consists of overviews of the present status and future trends in research opportunities using cold neutrons as well as topical papers focusing on the areas of small angle neutron scattering, reflectivity and spectroscopic studies of a rich variety of materials from adsorbed molecules to thin films to coal to metallic glasses. These papers will benefit researchers who are interested in the characterization of microscopic properties of advanced materials.

Materials Research Using Cold Neutrons at Pulsed Neutron Sources Chun Keung Loong, 1999 *Fundamental Physics with Pulsed Neutron Beams* Christopher R. Gould, 2001 Low energy neutron beams are used to address many questions in nuclear physics, particle physics and astrophysics. The scientific issues include elucidating the nature of time reversal noninvariance, understanding the origin of the baryon asymmetry in the Universe, describing the weak interaction between quarks and between nucleons, understanding the origin of the elements in stellar and big bang nucleosynthesis. This book summarizes how spallation neutron sources work and discusses the advantages of pulsed beams in reducing systematic errors in precision measurements. It also describes recent breakthroughs in ultracold neutron production together with the physics that will be addressed by the new generation of intense neutron sources.

Lithium-ion Batteries Perla B. Balbuena, Yixuan Wang, 2004 This invaluable book focuses on the mechanisms of formation of a solid electrolyte interphase (SEI) on the electrode surfaces of lithium ion batteries. The SEI film is due to electrochemical reduction of species present in the electrolyte. It is widely recognized that the presence of the film plays an essential role in the battery performance and its very nature can determine an extended or shorter life for the battery. In spite of the numerous related research efforts, details on the stability of the SEI composition and its influence on the battery capacity are still controversial. This book carefully analyzes and discusses the most recent findings and advances on this topic.

Characterization and Testing of Materials for Nuclear Reactors International Atomic Energy Agency, 2007 This publication is concerned with the characterization of materials for industries in general and the nuclear energy sector in particular. The main focus is on research reactor based techniques with some discussion of other related methods such as positron annihilation. Demand for energy is rising with the increase in industrial development worldwide. Nuclear fission and fusion are seen as important future energy sources. Development of innovative reactor designs with high efficiency for fuel burnup is one of the challenges for fission. Materials resistant to high doses of radiation pose a major challenge for fusion. In both cases the development of well characterized high quality materials is essential for the safe
