Advances in Materials Science of Wood Pentti O. Kettunen, 2008-09-09 Volume is indexed by Thomson Reuters BCI WoS Wood which always looks quite solid to the naked eye actually possesses a very intricate and exquisite structure developed by Nature primarily to fulfil the requirements of a growing tree How well the structure satisfies the needs of a construction material as used by humans is quite another matter so to speak Besides being an important constructional material wood is today also an important source

of precursors for the medical and chemical compounds used by human beings These and many other aspects of wood are topics which materials science attempts to elucidate When wood is used as a constructional material human interest normally focuses on xylem the woody inner portion of the trunk of a tree The outer sections of the tree the bark and cambium mainly interest humans for reasons other than constructional As wood is an organic polymer matrix composite the study of wood might be assumed to be the province mainly of polymer scientists This is not true however materials scientists working on polymers are almost absent from research into wood The situation is actually quite odd since wood offers plenty of ideas which would also be applicable to synthetic polymers and their composites This situation is reflected by the contents of this publication
