Cryptography Apocalypse Roger A. Grimes, 2019-10-15. Will your organization be protected the day a quantum computer breaks encryption on the internet? Computer encryption is vital for protecting users' data and infrastructure in the digital age. Using traditional computing, even common desktop encryption could take decades for specialized crackers to break, and government and infrastructure-grade encryption would take billions of times longer. In light of these facts, it may seem that today's computer cryptography is a rock-solid way to safeguard everything from online passwords to the backbone of the entire internet. Unfortunately, many current cryptographic methods will soon be obsolete. In 2016, the National Institute of Standards and Technology (NIST) predicted that quantum computers will soon be able to break the most popular forms of public key cryptography. The encryption technologies we rely on every day: HTTPS, TLS, WiFi protection, VPNs.
