Intersection Theory William Fulton,2012-12-06 From the ancient origins of algebraic geometry in the solutions of polynomial equations through the triumphs of algebraic geometry during the last two centuries intersection theory has played a central role The aim of this book is to develop the foundations of this theory and to indicate the range of classical and modern applications Although a comprehensive history of this vast subject is not attempted the author points out some of the striking early appearances of the ideas of intersection theory A suggested prerequisite for the reading of this book is a first course in algebraic geometry Fulton s introduction to intersection theory has been well used for more than 10 years It is still the only existing complete modern treatise of the subject and received the Steele Prize for best exposition in August 1996   Introduction to Intersection Theory in Algebraic Geometry William Fulton,1984 Introduces some of the main ideas of modern intersection theory traces their origins in classical geometry and sketches a few typical applications Suitable for graduate students in mathematics this book describes the construction and computation of intersection products by means of the geometry of normal cones   **Recent Progress in Intersection Theory** Geir Ellingsrud,William Fulton,Angelo Vistoli,2012-12-06 The articles in this volume are an outgrowth of an International Confer ence in Intersection Theory that took place in Bologna Italy December 1997 In a somewhat unorthodox format aimed at both the mathematical community as well as summer school students talks were research oriented as well as partly expository There were four series of expository talks by the following people M Brion University of Grenoble on Equivariant Chow groups and applications H Flenner University of Bochum on Joins and intersections E M Friedlander Northwestern University on Intersection products for spaces of algebraic cycles R Laterveer University of Strasbourg on Bigraded Chow co homology Four introductory papers cover the following topics and bring the reader to the forefront of research 1 the excess intersection algorithm of Stuckrad and Vogel combined with the deformation to the normal cone together with many of its geo metric applications 2 new and very important homotopy theory techniques that are now used in intersection theory 3 the Bloch Beilinson filtration and the theory of motives 4 algebraic stacks the modern language of moduli theory Other research articles concern such active fields as stable maps and Gromov Witten invariants deformation theory of complex varieties and others Organizers of the conference were Rudiger Achilles Mirella Manaresi and Angelo Vistoli all from the University of Bologna the scientific com mittee consisted of Geir Ellingsrud University of Oslo William Fulton University of Michigan at Ann Arbor and Angelo Vistoli The conference was financed by the European Union contract no   *Complete Intersections* S. Intersection Theory W. Fulton,2013-06-29 From the ancient origins of algebraic geometry in the solution of polynomial equations through the triumphs of algebraic geometry during the last two cen turies intersection theory has played a central role Since its role in founda tional crises has been no less prominent the lack of a complete modern treatise on intersection theory has been something of an embarrassment The aim of this book is to develop the foundations of intersection theory and

to indicate the range of classical and modern applications Although a comprehensive his tory of this vast subject is not attempted we have tried to point out some of the striking early appearances of the ideas of intersection theory Recent improvements in our understanding not only yield a stronger and more useful theory than previously available but also make it possible to devel op the subject from the beginning with fewer prerequisites from algebra and algebraic geometry It is hoped that the basic text can be read by one equipped with a first course in algebraic geometry with occasional use of the two appen dices Some of the examples and a few of the later sections require more spe cialized knowledge The text is designed so that one who understands the con structions and grants the main theorems of the first six chapters can read other chapters separately Frequent parenthetical references to previous sections are included for such readers The summaries which begin each chapter should fa cilitate use as a reference **Joins and Intersections** H. Flenner,L. O'Carroll,W. Vogel,2013-06-29 Dedicated to the memory of Wolfgang Classical Intersection Theory see for example Wei Wei treats the case of proper intersections where geometrical objects usually subvarieties of a non singular variety intersect with the expected dimension In 1984 two books appeared which surveyed and developed work by the individual authors co workers and others on a refined version of Intersection Theory treating the case of possibly improper intersections where the intersection could have ex cess dimension The first by W Fulton Full recently revised in updated form used a geometrical theory of deformation to the normal cone more specifically deformation to the normal bundle followed by moving the zero section to make the intersection proper this theory was due to the author together with R MacPherson and worked generally for intersections on algeb raic manifolds It represents nowadays the standard approach to Intersection Theory The second by W Vogel Vogl employed an algebraic approach to inter sections although restricted to intersections in projective space it produced an intersection cycle by a simple and natural algorithm thus leading to a Bezout theorem for improper intersections It was developed together with J Stiickrad and involved a refined version of the classical technique ofreduc tion to the diagonal here one starts with the join variety and intersects with successive hyperplanes in general position laying aside components which fall into the diagonal and intersecting the residual scheme with the next hyperplane since all the hyperplanes intersect in the diagonal the process terminates Some Problems of Unlikely Intersections in Arithmetic and Geometry Umberto Zannier,David William Masser,2012 This book considers the so called Unlikely Intersections a topic that embraces well known issues such as Lang s and Manin Mumford s concerning torsion points in subvarieties of tori or abelian varieties More generally the book considers algebraic subgroups that meet a given subvariety in a set of unlikely dimension The book is an expansion of the Hermann Weyl Lectures delivered by Umberto Zannier at the Institute for Advanced Study in Princeton in May 2010 The book consists of four chapters and seven brief appendixes the last six by David Masser The first chapter considers multiplicative algebraic groups presenting proofs of several developments ranging from the origins to recent results and discussing many applications and relations with other contexts The second chapter considers an analogue

in arithmetic and several applications of this The third chapter introduces a new method for approaching some of these questions and presents a detailed application of this by Masser and the author to a relative case of the Manin Mumford issue The fourth chapter focuses on the Andr Oort conjecture outlining work by Pila   **Random Walk Intersections** Xia Chen,2010 Involves important and non trivial results in contemporary probability theory motivated by polymer models as well as other topics of importance in physics and chemistry   **99 Points of Intersection** Hans Walser,2006-09-14 A collection of surprising concurrences of lines with some typical methods for proving their existence   Topology and Geometry of Intersections of Ellipsoids in R^n Santiago López de Medrano,2023-05-24 This book gives an overview of research in the topology and geometry of intersections of quadrics in mathbb R n with a focus on intersections of concentric ellipsoids and related spaces Unifying and organizing material previously spread over many articles it also contains new results The first part provides very detailed foundations of a wide ranging theory that could be useful for future developments It includes chapters on general intersections of quadrics operations on them and intersections of concentric and coaxial quadrics Moving from the general to the specific the second part focuses on a topological description of transverse intersections of concentric ellipsoids including a complete description of the case of three ellipsoids and of some large families of more than three of them The third part looks at relations to other areas of mathematics such as dynamical systems complex geometry contact and symplectic geometry and other applications An appendix gathers some technical items and also gives an account of the origins motivations and progression of the subject including historical recollections of the author who has been central to its development   **Math Intersections** Joyce Glatzer,1990 Challenge students to solve problems and explain their processes as they diagram problems determine true or false statements describe a problem without answering it and demonstrate an understanding of terminology Reproducible   *Intersections of Hirzebruch–Zagier Divisors and CM Cycles* Benjamin Howard,Tonghai Yang,2012-01-06 This monograph treats one case of a series of conjectures by S Kudla whose goal is to show that Fourier of Eisenstein series encode information about the Arakelov intersection theory of special cycles on Shimura varieties of orthogonal and unitary type Here the Eisenstein series is a Hilbert modular form of weight one over a real quadratic field the Shimura variety is a classical Hilbert modular surface and the special cycles are complex multiplication points and the Hirzebruch Zagier divisors By developing new techniques in deformation theory the authors successfully compute the Arakelov intersection multiplicities of these divisors and show that they agree with the Fourier coefficients of derivatives of Eisenstein series   Minimal Free Resolutions over Complete Intersections David Eisenbud,Irena Peeva,2016-03-08 This book introduces a theory of higher matrix factorizations for regular sequences and uses it to describe the minimal free resolutions of high syzygy modules over complete intersections Such resolutions have attracted attention ever since the elegant construction of the minimal free resolution of the residue field by Tate in 1957 The theory extends the theory of matrix factorizations of a non zero divisor initiated by Eisenbud in 1980 which yields a

description of the eventual structure of minimal free resolutions over a hypersurface ring Matrix factorizations have had many other uses in a wide range of mathematical fields from singularity theory to mathematical physics *Some Problems of Unlikely Intersections in Arithmetic and Geometry* Umberto Zannier,2012-03-25 This book considers the so called Unlikely Intersections a topic that embraces well known issues such as Lang s and Manin Mumford s concerning torsion points in subvarieties of tori or abelian varieties More generally the book considers algebraic subgroups that meet a given subvariety in a set of unlikely dimension The book is an expansion of the Hermann Weyl Lectures delivered by Umberto Zannier at the Institute for Advanced Study in Princeton in May 2010 The book consists of four chapters and seven brief appendixes the last six by David Masser The first chapter considers multiplicative algebraic groups presenting proofs of several developments ranging from the origins to recent results and discussing many applications and relations with other contexts The second chapter considers an analogue in arithmetic and several applications of this The third chapter introduces a new method for approaching some of these questions and presents a detailed application of this by Masser and the author to a relative case of the Manin Mumford issue The fourth chapter focuses on the Andr Oort conjecture outlining work by Pila *Commutative Algebra* Irena Peeva,2013-02-01 This contributed volume brings together the highest quality expository papers written by leaders and talented junior mathematicians in the field of Commutative Algebra Contributions cover a very wide range of topics including core areas in Commutative Algebra and also relations to Algebraic Geometry Algebraic Combinatorics Hyperplane Arrangements Homological Algebra and String Theory The book aims to showcase the area especially for the benefit of junior mathematicians and researchers who are new to the field it will aid them in broadening their background and to gain a deeper understanding of the current research in this area Exciting developments are surveyed and many open problems are discussed with the aspiration to inspire the readers and foster further research Topics in Discrete Mathematics Martin Klazar,Jan Kratochvil,Martin Loebl,Robin Thomas,Pavel Valtr,2007-05-28 The book offers the readers a collection of high quality papers in selected topics of Discrete Mathematics to celebrate the 60th birthday of Professor Jarik Ne etril Leading experts have contributed survey and research papers in the areas of Algebraic Combinatorics Combinatorial Number Theory Game theory Ramsey Theory Graphs and Hypergraphs Homomorphisms Graph Colorings and Graph Embeddings **Higher Dimensional Complex Varieties** Marco Andreatta,Thomas Peternell,2011-07-20 No detailed description available for Higher Dimensional Complex Varieties Spatially Independent Martingales, Intersections, and Applications Pablo Shmerkin,Ville Suomala,2018-02-22 The authors define a class of random measures spatially independent martingales which we view as a natural generalization of the canonical random discrete set and which includes as special cases many variants of fractal percolation and Poissonian cut outs The authors pair the random measures with deterministic families of parametrized measures and show that under some natural checkable conditions a s the mass of the intersections is H lder continuous as a function of This continuity phenomenon turns out to underpin a large amount of geometric

information about these measures allowing us to unify and substantially generalize a large number of existing results on the geometry of random Cantor sets and measures as well as obtaining many new ones Among other things for large classes of random fractals they establish a very strong versions of the Marstrand Mattila projection and slicing results as well as dimension conservation b slicing results with respect to algebraic curves and self similar sets c smoothness of convolutions of measures including self convolutions and nonempty interior for sumsets and d rapid Fourier decay Among other applications the authors obtain an answer to a question of I aba in connection to the restriction problem for fractal measures *The Monodromy Groups of Isolated Singularities of Complete Intersections* Wolfgang Ebeling,2006-11-15 *Commutative Algebra* Winfried Bruns,Aron Simis,2006-11-14 The central theme of this volume is commutative algebra with emphasis on special graded algebras which are increasingly of interest in problems of algebraic geometry combinatorics and computer algebra Most of the papers have partly survey character but are research oriented aiming at classification and structural results
