Handbook of Brain Connectivity Viktor K. Jirsa, A.R. McIntosh, 2007-08-16 Our contemporary understanding of brain function is deeply rooted in the ideas of the nonlinear dynamics of distributed networks Cognition and motor coordination seem to arise from the interactions of local neuronal networks which themselves are connected in large scales across the entire brain The spatial architectures between various scales inevitably influence the dynamics of the brain and thereby its function But how can we integrate brain connectivity amongst these structural and functional domains Our Handbook provides an account of the current knowledge on the measurement analysis and theory of the anatomical and functional connectivity of the brain All contributors are leading experts in various fields concerning structural and functional brain connectivity In the first part of the Handbook the chapters focus on an introduction and discussion of the principles underlying connected neural systems The second part introduces the currently available non invasive technologies for measuring structural and functional

connectivity in the brain Part three provides an overview of the analysis techniques currently available and highlights new developments Part four introduces the application and translation of the concepts of brain connectivity to behavior cognition and the clinical domain

Nonlinear Dynamical Analysis Of The Eeg: Proceedings Of The 2nd Annual Conference B H Jansen, M E Brandt, 1993-04-27 This volume contains papers contributed by scientists from a wide variety of disciplines on the application of nonlinear dynamics chaos theory in the study of brain function

Statistical analysis of multi-cell recordings: linking population coding models to experimental data Matthias Bethge, Philipp Berens, Jakob Macke, 2012-01-01 Modern recording techniques such as multi electrode arrays and 2 photon imaging are capable of simultaneously monitoring the activity of large neuronal ensembles at single cell resolution This makes it possible to study the dynamics of neural populations of considerable size and to gain insights into their computations and functional organization The key challenge with multi electrode recordings is their high dimensional nature Understanding this kind of data requires powerful statistical techniques for capturing the structure of the neural population responses and their relation with external stimuli or behavioral observations Contributions to this Research Topic should advance statistical modeling of neural populations Questions of particular interest include 1 What classes of statistical methods are most useful for modeling population activity 2 What are the main limitations of current approaches and what can be done to overcome them 3 How can statistical methods be used to empirically test existing models of probabilistic population coding 4 What role can statistical methods play in formulating novel hypotheses about the principles of information processing in neural populations This Research Topic is connected to a one day workshop at the Computational Neuroscience Meeting 2009 in Berlin <http://www.cns.org.org/2009/workshops.shtml> and <http://www.kyb.tuebingen.mpg.de/bethge/workshops/cns2009/>
