Abstract

A programming language is a tool and a vehicle for applications.

The need to promote the evolution of Prolog towards a more expressive new logic programming language.

A large medium-term national research project.

Extensions to Logic Programming:

new forms of computational reasoning, with explicit negation, constraint programming, parallelism and distribution support.

The resulting language: PROLOPPE, will integrate the above aspects.

A trully efficient implementation:

innovative execution model joint implicit and explicit parallelism, distribution over heterogenous multiple processor architectures.

A wide variety of applications: decision support systems natural language processing diagnosis scheduling, robot cooperation.

This paper is an edited version, by the authors, of part of the original proposal of the PROLOPPE Project which included contributions from C. Damásio, F. Menezes, J. C. Cunha, J. J. Alferes, L. M. Pereira, P. Barahona, P. D. Medeiros, S.P. Abreu, from the Universidade Nova de Lisboa, and A. Matos, A. P. Tomás, F. Silva, J. P. Leal, L. Damas, L. Lopes, M. Filgueiras, N. Moreira, R. Reis and V. S. Costa from the Universidade do Porto, and Miguel Calejo from Servisoft.

Parallel Logic Programming:

P-Prolog, a Parallel Logic Programming Language Rong Yang, 1987 P Prolog is put forward as an alternative proposal to the difficulties faced in the main research areas of parallel logic programmings which have been studied P Prolog provides the advantages of guarded Horn clauses while retaining don't know non determinism where required This monograph presents also an or tree model and an implementation scheme for it to combine and and or parallelism with reasonable efficiency The model and implementation scheme discussed can be applied to P Prolog and other parallel logic languages

Parallel Logic Programming Evan Tick, 1991 Highly parallel machines have been available for many years but because advances in hardware have always outpaced progress in software development designers and users of these machines have yet to realize their full potential Until recently there have been few if any high class parallel programming languages that could be implemented on the wide variety of parallel processing systems in use This book helps to redress the balance by teaching programming techniques as well as performance analysis of parallel programming languages and architectures using logic programming specifically it focuses on the Prolog like languages OR parallel Prolog and AND parallel FGHC Parallel Logic Programming brings to light practical applications of a previously esoteric theoretical area of parallel logic programming and is unique in presenting programming hand in hand with performance analysis of real empirical measurements Its quantitative approach to symbolic parallel programming provides students and professionals with tools for implementing and critically evaluating larger projects The book includes useful chapter summaries programming projects and a glossary Parallel and Constraint Logic Programming Ioannis Vlahavas, Panagiotis Tsarchopoulos, Ilias

Sakellariou, 2012-12-06 Constraint Logic Programming CLP an area of extreme research interest in recent years extends the semantics of Prolog in such a way that the combinatorial explosion a characteristic of most problems in the field of Artificial Intelligence can be tackled efficiently By employing solvers dedicated to each domain instead of the unification algorithm CLP drastically reduces the search space of the problem which leads to increased efficiency in the execution of logic programs CLP offers the possibility of solving complex combinatorial problems in an efficient way and at the same time maintains the advantages offered by the declarativeness of logic programming The aim of this book is to present parallel and constraint logic programming offering a basic understanding of the two fields to the reader new to the area The first part of the book gives an introduction to the fundamental aspects of conventional logic programming which is necessary for understanding the parts that follow The second part includes an introduction to parallel logic programming architectures and implementations proposed in the area Finally the third part presents the principles of constraint logic programming The last two parts also include descriptions of the supporting facilities for the two paradigms in two popular systems ECLIPSe and SICStus These platforms have been selected mainly because they offer both parallel and constraint features Annotated and explained examples are also included in the relevant parts offering a valuable guide and a first practical experience to the

reader Finally applications of the covered paradigms are presented The authors felt that a book of this kind should provide some theoretical background necessary for the understanding of the covered logic programming paradigms and a quick start for the reader interested in writing parallel and constraint logic programming programs However it is outside the scope of this book to provide a deep theoretical background of the two areas In that sense this book is addressed to a public interested in obtaining a knowledge of the domain without spending the time and effort to understand the extensive theoretical work done in the field namely postgraduate and advanced undergraduate students in the area of logic programming This book fills a gap in the current bibliography since there is no comprehensive book of this level that covers the areas of conventional parallel and constraint logic programming Parallel and Constraint Logic Programming An Introduction to Logic Parallelism and Constraints is appropriate for an advanced level course on Logic Programming or Constraints and as a reference for practitioners and researchers in industry **Special Issue on the Workshop on**

Parallel Logic Programming in PARLOG Steve Gregory, 1987 PARLOG is a logic programming language designed for efficient implementation on parallel machines It supports a declarative style of programming combined with an execution mechanism that can exploit the parallel architectures which are already available This book is a comprehensive study of the design application and implementation of PARLOG Parallel Logic Programming David Courtney Bosley, 1988 **Parallel Execution of Logic Programs** Anthony Beaumont, Gopal Gupta, 1991-12-11 Logic programming refers to execution of programs written in Horn logic Among the advantages of this style of programming are its simple declarative and procedural semantics high expressive power and inherent nondeterminism The papers included in this volume were presented at the Workshop on Parallel Logic Programming held in Paris on June 24 1991 as part of the 8th International Conference on Logic Programming The papers represent the state of the art in parallel logic programming and report the current research in this area including many new results The three essential issues in parallel execution of logic programs which the papers address are Which forms of parallelism or parallelism and parallelism stream parallelism data parallelism etc will be exploited Will parallelism be explicitly programmed by programmers or will it be exploited implicitly without their help Which target parallel architecture will the logic programs run on **Parallel Logic Programming Techniques** Stephen Taylor, 1989

Parallel Execution of Logic Programs John S. Conery,2012-12-06 This book is an updated version of my Ph D dissertation The AND OR Process Model for Parallel Interpretation of Logic Programs The three years since that paper was finished or so I thought then have seen quite a bit of work in the area of parallel execution models and programming languages for logic programs A quick glance at the bibliography here shows roughly 50 papers on these topics 40 of which were published after 1983 The main difference between the book and the dissertation is the updated survey of related work One of the appendices in the dissertation was an overview of a Prolog implementation of an interpreter based on the AND OR Process Model a simulator I used to get some preliminary measurements of parallelism in logic programs In the last three years I have been involved with three other implementations One was written in C and is now being installed on a small multiprocessor at the University of Oregon Most of the programming of this interpreter was done by Nitin More under my direction for his M S project The other two one written in Multilisp and the other in Modula 2 are more limited intended to test ideas about implementing specific aspects of the model Instead of an appendix describing one interpreter this book has more detail about implementation included in Chapters 5 through 7 based on a combination of ideas from the four interpreters
