River Basin:

The River Basin in History and Law Ludwik A. Teclaff, 2012-12-06 Fresh water is one of man's most vital needs. The distribution of water within river basins has a direct bearing on the organization of water resources development to meet this ever-expanding need. River basins, despite their very great diversity in other respects, have one physical characteristic in common: each is a more or less self-contained unit within whose bounds all the surface and part or all of the ground waters form an interconnected interdependent system. This interdependence has such far-reaching implications for pollution and flood control, apportionment of supply relations between upstream and downstream riparians, to mention only a few examples, that the river basin has become almost universally accepted within the past 20 or 30 years at least as the unit of optimal water resources development. Professor Teclaff's work, which was originally submitted to the New York University School of Law as a doctoral dissertation, is the first fully developed response to the important resolution passed by the International Law Association at its New York meeting in 1958 recognizing the legal nature of the international river basin. His study quite properly therefore poses the question whether the adoption of the river basin unit is a temporary phenomenon reflecting the current stage of technology and of administrative, economic and legal thought on water resources development, or whether the determinative influence of the river basin's physical unity, which has always operated in the past, will continue to operate in the future.

Flood Risk Management and the American River Basin National Research Council, Division on Earth and Life Studies, Commission on Geosciences, Environment and Resources, Committee on Flood Control Alternatives in the American River Basin, 1995-10-21 This book reviews the U.S. Army Corps of Engineers USACE investigations of flood control options for the American River basin and evaluates flood control feasibility studies for the watershed with attention to the contingency assumptions, hydrologic methods and other analyses supporting the flood control options. This book provides detailed comments on many technical issues, including a careful review of the 1991 National Research Council report American River Watershed Investigation and looks beyond the Sacramento case to broader questions about the nation's approach to flood risk management. It discusses how to utilize information available about flood hazard reduction alternatives for the American River basin, the potential benefits provided by various alternatives, the impacts of alternatives on environmental resources and ecosystems, and the trade-offs inherent in any choice among alternatives, which does not lie in the realm of scientists and engineers but in the arena of public decisionmaking.
