New treatment perspectives in autism spectrum disorders Roberto Canitano, Yuri Bozzi, 2015-04-17 Developing novel and more effective treatments that improve quality of life for individuals with autism spectrum disorders is urgently needed. To date, a wide range of behavioral interventions have been shown to be safe and effective for improving language and cognition and adaptive behavior in children and adolescents with ASD. However, many people with ASD can receive additional benefit from targeted pharmacological interventions. One of the major drawbacks in setting up therapeutic intervention is the remarkable individual differences found across individuals with ASD. As a matter of fact, the medications that are currently available address only symptoms associated with ASD and not the core domains of social and communication dysfunction. The pathogenesis paradigm shift of ASD towards synaptic abnormalities moved the research to pathway to disease that involve multiple systems and that are becoming the forefront of ASD treatment and are pointing toward the development of new targeted treatments. Some new therapeutics have been tested, and others are being studied. In this context, single gene disorders frequently associated with ASD, such as Rett Syndrome, Fragile X, and Tuberous Sclerosis, have been of significant aid as neurobiology of these disorders is more clear and has a potential to shed light on the altered signaling in ASD. However, much research is needed to further understand the basic mechanisms of disease and the relationship to idiopathic ASD. Clinical trials in children are underway with agents directed to core symptoms and to the associated disorders in the search of new therapeutics, and progress is expected with

possible new option for therapeutics in ASD in the upcoming future Children and Adolescents with ASD and their families can provide important information about their experience with new treatments and this should be a priority for future research In addition research performed on genetic mouse models of ASD will keep on providing useful information on the molecular pathways disrupted in the disease thus contributing to identify novel drug targets

Autism: The Movement (Sensing) Perspective a Decade Later Elizabeth B. Torres, Jonathan T. Delafield-Butt, Vikram K. Jaswal, Susan Crawford, Ashok Srinivasan, Brittany Travers, 2025-08-19 A decade ago in 2013 the Research Topic Autism the Movement Perspective proposed the radical idea that using movement and its sensations could help us better understand the many complex layers of autism spectrum disorders Inspired by earlier work from other fields the work positioned front and center approaches from neuromotor control infusing the research with new computational ideas to study autism across the human lifespan Through the lens of motor variability as a form of kinesthetic reafference causal inference and predictive codes the Research Topic brought together a group of researchers parents practitioners and self advocates to rethink autism as sensory motor differences contributing to the emergence of powerful coping mechanisms that advanced our understanding of how the human brain develops and functions Today with new improvements in biosensing technologies and neuroscience and the embodied and affective psychology on which development is based we revisit this Research Topic approaching autism anew through a modernized lens of precision aimed at enabling socio motor agency

Autism: The Movement Perspective Elizabeth B Torres, Anne M Donnellan, 2015-05-19 Autism Spectrum Disorders ASD is portrayed as cognitive and social disorders Undoubtedly impairments in communication and restricted repetitive behaviors that now define the disorders have a profound impact on social interactions But can we go beyond the descriptive observational nature of this definition and objectively measure that amalgamate of motions and sensations that we call behavior In this Research Topic we bring movement and its sensation to the forefront of autism research diagnosis and treatment We gather researchers across disciplines with the unifying goal of recognizing movement and sensory disturbances as core symptoms of the disorder We also hear confirmation from the perspective of autism self advocates and parents Those important sources of evidence along with the research presented in this topic demonstrate without a doubt that profound movement and sensory differences do exist in ASD and that they are quantifiable The work presented in this Research Topic shows us that quantifiable differences in movements have a better chance than current observational techniques to help us uncover subtle solutions that the nervous system with autism has already spontaneously self discovered and utilized in daily living Where the naked eye would miss the unique subtleties that help each individual cope instrumentation and fine kinematic analyses of

motions help us uncover inherent capacities and predispositions of the person with autism The work presented in this topic helps us better articulate through the voices of parents and self advocates those sensory motor differences that current inventories could not possibly uncover These differences are seldom perceived as they take place at timescales and frequencies that fall largely beneath our conscious awareness To the person in the spectrum living with this disorder and to the caregiver creating accommodations to help the affected loved one these subtleties are very familiar though Indeed they are often used in clever ways to facilitate daily routines We have waited much too long in science to listen to the very people that we are trying to define understand and help Being autism a social problem by definition it is remarkable that not a single diagnosis inventory measures the dyadic social interaction that takes place between the examiner and the examinees Indeed we have conceived the autistic person within a social context where we are incapable by definition of accepting those differences The burden is rather placed on the affected person to whom much too often we refer to in the third person as non verbal without intentionality without empathy or emotions without a theory of mind among other purely psychological guesses It is then too easy and shockingly allowed to reshape that person to mold that person to better conform to our social expectations and to extinguish behaviors that are socially unacceptable even through the use of aversive punishing reinforcement techniques if need be And yet none of those techniques have had a single shred of objective scientific evidence of their effectiveness We have not objectively measured once nor have we physiologically characterized once any of those perceived features that we so often use to observationally define what we may think the autistic phenotype may be We have not properly quantified beyond paper and pencil methods the effectiveness of interventions in autism Let us not forget when we do our science that we are all part of the broad human spectrum *Rhythm Vocabulary Charts* Ed Sueta,1985

Raising a Socially Successful Child Dr. Stephen Nowicki, 2024-03-19 A brilliant and perfectly timed William Stixrud co author of The Self Driven Child book showing how parents and educators can help children master the nonverbal language of social connection and success We all want our kids learn the social skills they need to thrive Yet many of today's kids are struggling to connect often with no apparent reason why In most cases the explanation is simple a child hasn't fully mastered the nonverbal language of everyday social interaction like how to take turns in a conversation how to respect boundaries of personal space or how to tell whether a friend is feeling happy or sad And yet children aren't taught nonverbal skills in the same formalized way they are taught reading and writing Instead they are expected to absorb these skills at school home and on the playground But between the steep rise in screen time and the social learning lost to Covid quarantines and school closures today's kids have had fewer opportunities to learn the rules of nonverbal behavior Fortunately parents and teachers can help kids shore up

these essential skills In *Raising a Socially Successful Child* Dr Stephen Nowicki reveals how to identify the nonverbal areas where a child might be struggling and equips readers with a set of simple exercises to help any child learn how to Follow the rhythm of conversations Express and read emotions in facial expressions and body language Understand the difference between appropriate and inappropriate touch Sense a person's mood based on their tone of voice And more Drawing on decades of research as well as dozens of stories from across the country *Raising a Socially Successful Child* is the practical guide to helping children master the nonverbal skills they need to succeed in childhood and their adult lives
