Real-time Coastal Observing Systems for Marine Ecosystem Dynamics and Harmful Algal Blooms Babin, Marcel, Roesler, Collin S., Cullen, John J., 2008-06-05. The proliferation of harmful phytoplankton in marine ecosystems can cause massive fish kills, contaminate seafood with toxins, impact local and regional economies and dramatically affect ecological balance. Real time observations are essential for effective short term operational forecasting, but observation and modelling systems are still being developed. This volume provides guidance for developing real time and near real time sensing systems for observing and predicting plankton dynamics, including harmful algal blooms in coastal waters. The underlying theory is explained and current trends in research and monitoring are discussed. Topics covered include coastal ecosystems and dynamics of harmful algal blooms, theory and practical applications of in situ and remotely sensed optical detection of microalgal distributions and composition, theory and practical applications of in situ biological and chemical sensors for targeted species and toxin detection, integrated observing systems and platforms for detection, diagnostic and predictive modelling of ecosystems and harmful algal blooms, including data assimilation techniques, observational needs for the public and government and future directions for research and operations.
