Distribution, Relative Abundance, and Movement of Skipjack Tuna, Katsuwonus Pelamis, in the Pacific Ocean Based on Japanese Tuna Longline Catches, 1964-67 Walter M. Matsumoto,1975 Catch data of the Japanese tuna longline fishery from 1964 to 1967 were analyzed to determine the distribution abundance and movement of skipjack tuna Katsuwonus pelamis in offshore waters of the Pacific Ocean Large skipjack tuna as well as larvae were found to be concentrated mainly in the east central equatorial Pacific Movement of skip jack tuna stocks was determined by following the shifting of high CPUE catch per unit effort cells from one quarter to the next The apparent movement of skipjack tuna stocks in the Pacific appeared to coincide with the circulation of the major ocean currents counterclockwise in the southern hemisphere and clockwise in the northern hemisphere except in the eastern Pacific where the current flow is counterclockwise The movement patterns of high CPUE suggested that skipjack tuna adults or their progeny could move from one area to the next The movement pattern was used also to determine the probable migratory routes followed by skipjack tuna tagged in the eastern Pacific and recovered near the Hawaiian and Christmas islands

Sea-surface Temperature Variability Analysis of Potential OTEC Sites Utilizing Satellite Data Fred M. Vukovich,United States. Department of Energy,1979 The primary purpose of this research was to perform an analysis of the constancy of the sea surface temperature in candidate locations for OTEC siting Most in situ data available to determine the constancy of the sea surface temperature were obtained using point sensors that recorded surface temperature at specific points and at

specific times or for some specific period These data while establishing certain gross or average patterns are inadequate for describing short term temperature variations for large areas and are insufficient for assessing the constancy of the temperature patterns relative to selecting potential sites for OTEC The only data available for analysis of the synoptic ocean surface temperature pattern are those obtained in the last five years by infrared scanning radiometer systems on earth observational satellites For this study the satellite infrared ir data for the period 1973 1977 were used to identify and locate major thermal fronts at the sea surface These data were then used to glean certain statistics on these fronts In situ data were used when available to determine temperature difference across specified thermal fronts This study was performed in three regional locations of interest to OTEC The specific regions are Region I Eastern Gulf of Mexico bounded by 22 N to 30 N and 91 W to the west coast of Florida including the Straits of Florida Region II the east coast of Florida bounded by 23 N to 32 N and the east coast of Florida to 79 W and Region III Puerto Rico and vicinity bounded by 17 to 19 N 64 to 68 W Results are presented and discussed
