Lymphocyte Activation:

Mechanisms of Lymphocyte Activation and Immune Regulation II S. Gupta, 2013-06-29 The activation of lymphocytes by physiologic ligands has become a central area of study for immunologists. Furthermore, lymphocytes offer many advantages for the study of general aspects of receptor-mediated cellular activation. For these reasons, research on the cellular and molecular aspects of the activation of lymphocytes by antigens, antigen analogues, lymphokines, and other growth factors has expanded enormously in the last several years. A series of conferences, The International Conferences on Lymphocyte Activation, has been initiated to meet the growing need for a forum for the discussion of the topics that are included within the area of lymphocyte activation. This volume represents the proceedings of the Second International Conference on Lymphocyte Activation and Immune Regulation held on February 18-20, 1988, at Newport Beach, California. The proceedings comprise four major sections. The first deals with the T cell receptors and T cell activation. It includes a model for the T cell receptor interaction with a complex of MHC plus antigen structure of γ c δ T cell receptor and their distinct isotypic forms, the role of zeta chain in the expression and structure of T cell receptors and its role in transmembrane signalling. The use of somatic cell mutants in the study of signal transduction function of the T cell antigen receptors and the early and late steps of signal transduction via a T cell antigen receptors are discussed.

Mechanisms of Lymphocyte Activation and Immune Regulation Sudhir Gupta, William E. Paul, Anthony Fauci, 2013-11-11 During the past 5 years, rapid progress has been made in the understanding of biochemical pathways for signal transduction in lymphocyte activation. Gene cloning technology has been instrumental in defining and making available in pure form a number of growth and differentiation factors in the characterization of their receptors and in the delineation of genes for the T cell receptor. This book is divided into 6 sections. Section 1 deals with the molecular structure of the T cell receptor. Section 2 discusses the role of the T cell receptor membrane ion channels and biochemical pathways of signal transduction in T cell activation. The molecular structures and biological and immunological effects of interleukin 1, interleukin 2, and interleukin 3 are presented in Section 3. This section also details the structure of interleukin 2 receptor and its use as a target for therapy for certain leukemias. Section 4 includes the biochemical events which occur following the delivery of the signal for B cell activation, proliferation, and differentiation by antigen growth differentiation factors. The molecular structure of B cell stimulating factors is also discussed. The role of oncogene expression in cellular activation and differentiation is included in Section 5. The cellular and molecular basis of natural killing and the molecular basis of cyclosporin A-mediated immunosuppression are discussed in detail in Section 6. We hope this book will serve as a reference work on basic mechanisms of lymphocyte activation, proliferation, and differentiation for immunologists and molecular biologists.

Mechanisms of Lymphocyte Activation and Immune Regulation IV Sudhir Gupta, Thomas Waldmann, 2012-12-06 In recent years, rapid progress has been made in the areas of T cell and B cell biology, cell-cell and cell-matrix/stroma interactions. The use of isolated subunits of the T cell receptor invariant chains has been

instrumental in defining their role in signal transduction and tyrosine phosphorylation A role of src family phosphotyrosine kinases in T cell activation has been demonstrated and several phosphotyrosine kinase substrates have been identified and their functions characterized Homologous recombinant techniques have led to the development of murine strains that lack CD4 or CD8 expression These models are likely to be instrumental in studying the role of T cell subsets in autoimmune disorders tissue transplant rejection and tumor rejection A role of major histocompatibility complex I in the development of T cell subsets and NK cells has been defined Recent data suggest a role of interaction between plasma membrane molecules of activated T helper cells and B cells B cells primed with plasma membrane of activated T helper cells and cytokines and interaction between bone marrow stromal cells and B cell progenitors and precursors in the B cell development proliferation and differentiation The structure and functions of adhesion molecules especially with regard to signal transduction and homing events are better defined

Immunodermatology Bijan Safai,Robert A. Good,2013-11-11 By 1940 immunological mechanisms had been proved to have fundamental influences on a great number and variety of skin reactions and skin diseases had brought to light a great number of fundamental immunological mechanisms that were basic to a wide range of different diseases dermatological and nondermatological The preeminence of dermatological research in the advancement of immunological knowledge should not astonish anyone For the skin is not only the most easily accessible tissue for producing and studying immunological reactions it is also the great organ of protection that meets the first onslaughts of inimical environmental forces and agents potential enemies both living and dead And protection is in essence what immunology is all about To get an idea of the long established role that testing the skin and the study of its many reactions has played in advancing general immunology one need recall only smallpox vaccination tuberculin testing testing with fungal extracts skin testing in hay fever asthma and serum sickness skin tests with toxins and toxoids the patch test the

ScholarlyEditions com The Pharmacology of Lymphocytes Michael A. Bray, John Morley, 2012-12-06 Immunopharmacology why not pharmacimmunology Professor H O Schild University College London 1962 An intact immune response is essential for survival as is evidenced by the various innate immune deficiency syndromes and by the emergence of the acquired immune deficiency syndrome AIDS as a pandemic during the last decade Substances which stimulate the immune response might contribute to the therapy of AIDS and its precursor AIDS related syndrome as well as of other clinical conditions in which immune responses can be diminished such as carcinoma and infections In other circumstances an intact or heightened immune response may pose clinical problems hence there is need to suppress or diminish components of the immune response For instance it is necessary to impair cellular immunity in order to ensure lasting acceptance of heterografts and it is already established that agents effective in transplantation are therapeutically effective in an range of autoimmune diseases More recently experimental studies have indicated that aberrant manifestations of humoral immunity as in allergies may also be amenable to pharmacological intervention Exploring Immunology Gordon MacPherson, Jon Austyn, 2013-03-01 This concise introductory textbook uses carefully chosen examples from clinical and experimental observations to provide an insight into the principles underlying the immune system As a result it encourages readers to ask critical questions in order to further advance our understanding of this unique organ Both authors are experienced lecturers and highly regarded researchers The book is professionally illustrated in four color throughout with beautiful artwork which by itself distinguish the title from any comparable title Website http://www.wiley-vch.de/home/immunology/target_blank
