Evolution and Mineralization of the Arabian-Nubian Shield Ahmad M.S. Al-Shanti, 2013-10-22 Evolution and Mineralization of the Arabian Nubian Shield Volume 2 documents the proceedings of a Symposium on the Arabian Nubian Shield This book is divided into five main topics structure and evolution metallogenesis plutonic rocks metamorphic rocks and ophiolites In these topics this text specifically discusses the Precambrian tectonics of North East Africa cratonic ore provinces separated by continental drift peralkaline granite in the western part of the Arabian Shield and Semail ophiolite and associated massive sulfide deposits The Upper Proterozoic volcanic activity in the northern Arabian Shield ore controls at the Mahd adh Dhahab gold mine shallow intrusive granites from Egypt and their relation to mineralization and chromites from the Al Ays and Semail complex are also deliberated This text is a good reference for students and individuals interested in the exposure of Precambrian crystalline rocks on the borders of the Red Sea Short Papers of the Fourth International Conference, Geochronology, Cosmochronology, Isotope Geology, 1978 Robert E. Zartman, 1978 **Proterozoic Geology of Western North America and Siberia** P. K. Link, Reed Stone Lewis, 2007 This volume is a compendium of research on the Belt Supergroup It is an outgrowth of Belt Symposium IV held in Salmon Idaho in July 2003 in conjunction with the Tobacco Root Geological Society annual field conference Because of the geographic extent and great thickness of the Belt Supergroup years of work have been required before conclusions are bona fide The Mesoproterozoic Belt Supergroup of western Montana and adjacent areas is geologically and economically important but it has been frustratingly hard to understand The previous Belt Symposium volumes offer an historical view of the progress of the science of geology in the western United States The advent of U Pb geochronology especially using the ion microprobe SHRIMP and laser ablation ICPMS has injected geochronometric reality into long standing arguments about Belt stratigraphy Several papers in this volume utilize these new tools to provide constraints on age and correlation of Belt strata Chamberlain et al Lewis et al Link et al and Doherty et al

Woolley,2019-09-02 The alkaline igneous rocks and carbonatites are compositionally and mineralogically the most diverse of all igneous rocks and apart from their scientific interest are of major and growing economic importance They are important repositories of certain metals and commodities indeed the only significant sources of some of them and include Nb the rare earths Cu V diamond phosphate vermiculite bauxite raw materials for the manufacture of ceramics and potentially Th and U The economic potential of these rocks is now widely appreciated particularly since the commencement of the mining of the Palabora carbonatite for copper and a host of valuable by products Similarly the crucial economic dominance of rare earth production from carbonatite related occurrences in China has stimulated the world wide hunt for similar deposits This volume describes and provides ready access to the literature for all known occurrences of alkaline igneous rocks and carbonatites of Antarctica Asia and Europe excluding the former USSR Australasia and oceanic islands More than 1 200 occurrences from 59 countries are outlined together with those of 57 oceanic islands and island groups The descriptions include geographical coordinates and information on general geology rock types petrography mineralogy age and economic aspects with the principal references cited There are 429 geological and distribution maps and a locality index As has been demonstrated by the three earlier volumes the present book is likely to be of considerable interest to mineral exploration companies as there are no comprehensive published reviews of the economic aspects of the alkaline rocks It will also interest research scientists in the fields of igneous petrology and volcanology and geologists concerned with the regional distribution of igneous rocks and their geodynamic relationships

shallow layers starting with a global review of the Earth's crustal structure. The third part focuses on the Earth's deep structure divided into its main units: the upper mantle, the transition zone, and upper mantle discontinuities, the D region at the base of the mantle, and the Earth's core. The fourth part comprises two chapters which discuss constraints on Earth structure from fields other than seismology, mineral physics, and geodynamics. Self-contained volume starts with an overview of the subject then explores each topic with in-depth detail. Extensive reference lists and cross references with other volumes to facilitate further research. Full color figures and tables support the text and aid in understanding.
