Indigenous and Tribal Peoples and Cancer Gail Garvey, 2024-09-04

Although cancer survival has improved markedly in developed countries in recent decades not all groups have benefited equally. In particular Indigenous and Tribal peoples continue to have poorer cancer outcomes than their non Indigenous counterparts. The available evidence suggests these disparities are linked to a complex combination of factors including higher incidence of cancers associated with a high case fatality later stage of diagnosis reduced access to cancer treatment and poorer overall health. Much research is underway to explore approaches to improving health system responses for Indigenous and Tribal peoples. A developing evidence base is supporting effective translation of knowledge into practice. This book offers a global perspective on this evidence base written from Indigenous perspectives. This book is the first comprehensive publication to report on cancer incidence mortality prevalence survival and inequities for Indigenous and Tribal peoples globally with the aim of enhancing global efforts to improve outcomes for these populations. Its content and approach are led by Indigenous researchers with international reputations in health and cancer research. Chapters provide important information and data to support Indigenous specific targeted cancer awareness and early detection campaigns. This book goes beyond a discussion of the issues and challenges in Indigenous health with a strengths based approach to discussing successful health interventions research projects research translation and living well both with and beyond cancer. Cardiovascular Toxicities of Breast Cancer Treatment: Emerging Issues in Cardio-Oncology Sharad Goyal,Bruce George Haffty,2016-05-20 Cancer and cardiovascular disease CVD are the two most common causes of mortality and morbidity worldwide The incidence of both cancer and cardiovascular disease increases with age With increased life expectancy the burden of both these diseases will increase substantially in coming years Patients with CVD share multiple common risk factors and lifestyle behaviors in addition to frequently suffering from multiple comorbid conditions Tobacco use hypertension high cholesterol diabetes physical inactivity and poor nutrition are all established risk factors of heart disease Patients with diseases such as breast cancer may develop CVD from treatment such as use of chemotherapy and RT Effects on the heart are a potentially significant and serious clinical problem in radiation therapy treatment of breast cancer Over the course of the past 50 years there have been great advances in the delivery of RT due to the development of new techniques beam energy improvement in imaging modalities and development of image registration strategies It is hypothesized that cardiac damage from RT is correlated to the dose absorbed by the heart and differs between left and right breast radiotherapy The damage to cardiac micro and macro vasculature is the pathophysiological cause of RT related heart disease Given the growing clinical relevance of cardio oncology this Frontiers in Oncology Research Topic provides a venue for disseminating focused reviews and cutting edge research in this quickly growing field We encourage submission of original papers and reviews dealing with cardiac toxicity after breast cancer treatment motion management to reduce cardiac exposure imaging to evaluate potential cardiac toxicities and primary prevention of cardiac disease in the breast cancer patient Women in radiation oncology: 2021 Christina Tsien,Radka Stoyanova,Alina Mihaela Mihai,2023-04-12

Role of SRS/SBRT in Oligometastatic Disease Michael T. Milano,Dwight E. Heron,Alina Mihaela Mihai,2020-02-13 Oligometastatic disease represents an intermediate state between the early localized disease and widespread metastatic malignancy Some patients with oligometastatic disease treated by ablative therapies to all sites of metastatic disease can achieve long disease free survival and sometimes cure Stereotactic radiosurgery SRS and stereotactic body radiation therapy SBRT are accepted treatment options for these patients achieving high rates of local control While most of the studies report

outcomes of SBRT for solitary oligometastasis patients with oligometastatic disease might present with multiple concurrent lesions either in the same organ or in neighboring organs There are few studies addressing the role of SBRT in patients with multiple concurrent oligometastases Furthermore these patients likely recur either in the same organ or at distance Therefore the need for retreatment with SBRT might be required There remains a dearth of data regarding the re irradiation after prior SBRT toxicity and dose volume constraints Particularly as it related to significant improvements in systemic therapies including immunotherapies it is likely that patients with widespread metastases can become oligometastatic after systemic treatments While targeted immune therapies and SBRT are increasingly used in patients with oligometastatic disease their sequencing interaction and toxicities have not been studied and are poorly understood In this e book we discuss the state of the science of oligometastatic disease SBRT in a variety of locations and outline potential future direction of research efforts *Relative Radiation Sensitivities of Human Organ Systems* Kurt I.
