Understanding the behaviour of gases in the context of radioactive waste disposal is a fundamental requirement in
developing a safety case for the disposal of radioactive waste Of particular importance are the long term performance of
bentonite buffers and cement based backfill materials that may be used to encapsulate and surround the waste in a
repository and the behaviour of plastic clays indurated mudrocks and crystalline formations that may be the host rocks for a
repository The EC Euratom programme funded project FORGE has provided new insights into the processes and mechanisms
governing gas generation and migration with the aim of reducing uncertainty This volume brings together papers on aspects
of this topic arising from both the FORGE project and work undertaken elsewhere This has been achieved by the acquisition
of new experimental data coupled with modelling through a series of laboratory and field scale experiments performed at a
