

X-ray Radiography Principle

- X-rays are produced when a high speed moving electron get collided with nucleus of an atom X-rays are produced in a X-ray tube which consist of a glass or ceramic envelope containing anode a positively charged electrode and cathode a negatively charged electrode, evacuated to an ultra high vacuum of 10^{-9} hector pascal.
- Cathode act as a producer of electrons, when electrical tension setup between cathode and anode, these electrons are attracted by anode and get accelerated up.
- These electrons from cathode are concentrated into a beam by a focussing cup and when these electrons get collided with anode, a part of their energy is transformed into X-radiation called as X-rays.

DBS have shown significant results in the treatment of addiction ranging from nicotine cocaine heroin to alcohol dependence. Specifically, research investigating the effects of neurofeedback on nicotine dependent patients showed that modulation of the anterior cingulate cortex can decrease smokers craving for nicotine. In several studies, decreased craving was found in alcohol dependent patients after TMS or tDCS stimulation of the anterior cingulate cortex or the dorsolateral prefrontal cortex. Changing the behavior of neural networks either through the modulation of neural spiking or threshold of neural firing presents another dimension to rehabilitation through neural rewiring or neural smithing. Neuromodulation through non-invasive brain stimulation techniques have been used beyond the treatment of addiction. The capability to modulate macro and micro brain networks through external stimulation have provided a long term rehabilitation approach to solving neurological issues such as tinnitus, primary headaches, poststroke gait disorders etc. The initial goal is to seek new advances in non-invasive brain stimulation techniques as a rehabilitation approach to solving neurological issues. The second goal is to understand how external neuromodulation effects brain networks by modifying cortical excitability, mimicking the long term depression (LTD) of synaptic plasticity and sliding of the modification threshold for increased excitation or long term potentiation (LTP) and decreased excitation or LTD as an example. Computational and mathematical models have been used to capture how neuromodulation effects the brain through the modeling of brain networks and hubs, neural networks mathematically represented as graphs comprised of nodes (neural elements) and edges (their connections) and advanced signal processing techniques.

National Library of Medicine Audiovisual Catalog, 1978 The Soviet Journal of Nondestructive Testing, 1967 Nuclear Science Information of Japan. Oral Presentation, 1998 **Biomedical Communications**, 1983 Radiology, 1976 Molecular Imaging in Neuroscience Najam Arfeen Sharif, 1993. This book reflects the recent dramatic advances in the use of modern imaging techniques to visualize and quantify the various components of cell structure and cell functional activity in the nervous system. Readers will find detailed protocols for imaging neurotransmitter and receptor mRNAs using radioactive and non-radioactive in situ hybridization technology. Methods for visualizing transmitter and drug receptors using quantitative autoradiography, sequence specific antibodies and immunocytochemistry are also clearly described. Plus the book covers the imaging of biological activity in living cells including methods of monitoring intracellular pH and calcium mobilization using selective ion sensitive dyes in conjunction with flow cytometry and video microscopy. This is an essential guide for researchers wanting to exploit these powerful new techniques for their studies in neuropharmacology, neuroanatomy, neurogenetics, neuropathology and pharmaceutical research: receptors and receptor function in the nervous system. They represent the state of the art for studying brain function and dysfunction in the laboratory. It will be of major interest to neuroscientists and pharmacologists.
