Simulation

Once the amount of radiation to be given has been accurately calculated, the patient then goes to the simulator to determine what settings are to be selected for the actual treatment using a linear accelerator.

The settings are determined by taking a series of x-rays to make sure that the tumour is in the correct position ready to receive the ionising radiation.

Tumor Response Monitoring and Treatment Planning A. Heuck, P. Lukas, P. Kneschaurek, M. Mayr, 2013-12-11 Medical imaging progressed to a standard undreamt of not very many years ago The advances are due to continuous development of radiological techniques and the introduction of magnetic resonance imaging With the improved and new methods three dimensional target volumes for radiation therapy can be defined with hitherto unknown precision This leads to an improvement in irradiation techniques and as a consequence to a higher likelihood of tumor control and a lower risk of normal tissue complications Besides the improvement in irradiation techniques the new imaging methods may enable great strides in tumor response monitoring not only in the detection of morphological alterations but also by showing physiological changes in the tumor during and after treatment by means of MRI and PET This not only leads to better prognostic information but may also allow early evaluation of the response to treatment It may then be possible to individualize the radiation dose but also the alternative treatment for non responders This is certainly a future direction for radiation oncology

Knowledge-based Radiotherapy Treatment Planning Lindsey Appenzoller Olsen, 2015 Knowledge based planning KBP has become a prominent area of research in radiation oncology in the last five years The development of KBP aims to address the

lack of systematic quality control and plan quality variability in radiotherapy treatment planning by providing achievable patient specific optimization objectives derived from a model trained with a cohort of previously treated site specific plans This dissertation intended to develop evaluate and implement a knowledge based planning system to reduce variability and improve radiotherapy treatment plan quality The project aimed to 1 develop and validate an algorithm to train mathematical models that predict dose volume histograms for organs at risk in radiotherapy planning 2 implement the algorithm into a software application in order to transfer the technology into clinical practice and 3 evaluate the impact of the software system algorithm application on reducing variability and improving radiotherapy treatment plan quality through knowledge transfer The presented work demonstrates that a KBP model is beneficial to radiotherapy planning The developed models adequately describe what is dosimetrically achievable for patient specific anatomy and have proven useful in outlier detection for quality control of radiotherapy planning The KBP paradigm has also demonstrated ability to improve treatment plan quality through benchmarking and transfer of knowledge between institutions
