Encyclopedia of Modern Coral Reefs David Hopley, 2010-11-26 Coral reefs are the largest landforms built by plants and animals Their study therefore incorporates a wide range of disciplines This encyclopedia approaches coral reefs from an earth science perspective concentrating especially on modern reefs Currently coral reefs are under high stress most prominently from climate change with changes to water temperature sea level and ocean acidification particularly damaging Modern reefs have evolved through the massive environmental changes of the Quaternary with long periods of exposure during glacially lowered sea level periods and short periods of interglacial growth The entries in this encyclopedia condense the large amount of work carried out since Charles Darwin first attempted to understand reef evolution Leading authorities from many countries have contributed to the entries covering areas of geology geography and ecology providing comprehensive access to the most up to date research on the structure form and processes operating on Quaternary coral reefs

Vertebrates in Complex Tropical Systems Mireille L. Harmelin-Vivien, Francois Bourliere, 2012-12-06 This book addresses the question of what determines species richness in tropical animals by comparing and contrasting the communities of the five major classes of vertebrates in two environments considered to be the most species rich on Planet Earth the coral reef and the rainforest All the contributors were asked to examine how so many species could coexist in such communities and to discuss the ways species assemblages might have evolved over time Because the coauthors are ecologists emphasis is quite naturally placed on the first of these two questions and the factors contributing to the maintenance of a diversity are discussed at length However the question of the very origin of species richness can never be eluded though it is more an evolutionary problem than an ecological one it has therefore also been given some attention occasionally Since we believe that long term descriptive data and extended field experience are absolutely essential to formulate meaningful questions and propose realistic models contributors were selected on the basis

of their prolonged field practice all of them actually spent years in the field and or participated in long term research programs The present volume has its origin in a symposium held on August 15 1986 at Syracuse New York during the Fourth International Congress of Ecology
