Rainwater Tank Systems for Urban Water Supply Ashok K. Sharma,Donald Begbie,Ted Gardner,2015-05-15 Rainwater tank systems have been widely adopted across the world to provide a safe local source of water in underdeveloped rural areas a substitution for mains water for non potable end uses in water stressed urban areas as well as providing flooding control in monsoonal climates such as Korea or combined sewer systems such as Germany The importance of these systems in cities has grown as water managers seek to provide a range of decentralised solutions to supply constraints of current water supply systems whilst reducing the impact of urban development on the natural environment and increasing resilience to the impacts of climate change Rainwater tank systems are now often implemented under integrated urban water management IUWM and water sensitive urban design WSUD philosophies which take a holistic view of the urban water cycle Rainwater Tank Systems for Urban Water Supply is based on a comprehensive multi million dollar research program that was undertaken in South East Queensland SEQ Australia in response to the Millennium drought when the water supply level in the regions drinking water dams dropped to 17% in July 2007 and the area came close to running out of water In particular the book provides insights and detailed analysis of design modelling implementation operation energy usage economics management health risk social perceptions and implications for water quality quantity of roof water runoff The approaches and methodologies included in Rainwater Tank Systems for Urban Water Supply inform and validate research programs and provide insights on the expected performance and potential pitfalls of the adoption of rainwater tanks systems including actual harvested yield and resulting mains water savings optimal sizing for rainwater storages and roof collection systems expected water quality and implications for managing public health risks

Water Demand Management David Butler,Fayyaz Ali Memon,2005-12-01 A common characteristic of water demand in urban areas worldwide is its inexorable rise over many years continued growth is projected over coming decades The chief influencing factors are population growth and migration together with changes in lifestyle demographic structure and the possible effects of climate change the detailed implications of climate change are not yet clear and anyway will depend on global location but must at least increase the uncertainty in security of supply This is compounded by rapid development creeping urbanization and in some places rising standards of living Meeting this increasing demand from existing resources is self evidently an uphill struggle particularly in water stressed scarce regions in the developed and developing world alike There are typically two potential responses either supply side meeting demand with new resources or demand side managing consumptive demand itself to postpone or avoid the need to develop new resources There is considerable pressure from the general public regulatory agencies and some governments to minimise the impacts of new supply projects e g building new reservoirs or inter regional transfer schemes implying the emphasis should be shifted towards managing water demand by best utilising the water that is already available

Water Demand Management has been prepared by the academic government and industry network WATERSAVE The concept of the book is to assemble a comprehensive picture of demand management topics ranging from technical to social and legal aspects through expert critical literature reviews The depth and breadth of coverage is a unique contribution to the field and the book will be an invaluable information source for practitioners and researchers including water utility engineers planners environmental regulators equipment and service providers and postgraduates Contents Water consumption trends and demand forecasting techniques The technology design and utility of rainwater catchment systems Understanding greywater

treatment Water conservation products Water conservation and sewerage systems An introduction to life cycle and rebound effects in water systems Developing a strategy for managing losses in water distribution networks Demand management in developing countries Drivers and barriers for water conservation and reuse in the UK The economics of water demand management Legislation and regulation mandating and influencing the efficient use of water in England and Wales Consumer reactions to water conservation policy instruments Decision support tools for water demand management
