Mitchell, 1985-10-01 Machine Learning An Artificial Intelligence Approach contains tutorial overviews and research papers representative of trends in the area of machine learning as viewed from an artificial intelligence perspective The book is organized into six parts Part I provides an overview of machine learning and explains why machines should learn Part II covers important issues affecting the design of learning programs particularly programs that learn from examples It also describes inductive learning systems Part III deals with learning by analogy by experimentation and from experience Parts IV and V discuss learning from observation and discovery and learning from instruction respectively Part VI presents two studies on applied learning systems one on the recovery of valuable information via inductive inference the other on inducing models of simple algebraic skills from observed student performance in the context of the Leeds Modeling System LMS This book is intended for researchers in artificial intelligence computer science and cognitive psychology students in artificial intelligence and related disciplines and a diverse range of readers including computer scientists robotics experts knowledge engineers educators philosophers data analysts psychologists and electronic engineers *Machine Learning* Ryszard S. Michalski, George Tecuci, 1994-02-09 Multistrategy learning is one of the newest and most promising research directions in the development of machine learning systems The objectives of research in this area are to study trade offs between different learning strategies and to develop learning systems that employ multiple types of inference or computational paradigms in a learning process Multistrategy systems offer significant advantages over monostategy systems They are more flexible in the type of input they can learn from and the type of knowledge they can acquire As a consequence multistrategy systems have the potential to be applicable to a wide range of practical problems This volume is the first book in this fast growing field It contains a selection of contributions by leading researchers specializing in this area See below for earlier volumes in the series Machine Learning R.S. Michalski, J.G. Carbonell, T.M. Mitchell, 2013-04-17 The ability to learn is one of the most fundamental attributes of intelligent behavior Consequently progress in the theory and computer modeling of learning processes is of great significance to fields concerned with understanding intelligence Such fields include cognitive science artificial intelligence information science pattern recognition psychology education epistemology philosophy and related disciplines The recent observance of the silver anniversary of artificial intelligence has been heralded by a surge of interest in machine learning both in building models of

human learning and in understanding how machines might be endowed with the ability to learn This renewed interest has spawned many new research projects and resulted in an increase in related scientific activities In the summer of 1980 the First Machine Learning Workshop was held at Carnegie Mellon University in Pittsburgh In the same year three consecutive issues of the International Journal of Policy Analysis and Information Systems were specially devoted to machine learning No 2 3 and 4 1980 In the spring of 1981 a special issue of the SIGART Newsletter No 76 reviewed current research projects in the field This book contains tutorial overviews and research papers representative of contemporary trends in the area of machine learning as viewed from an artificial intelligence perspective As the first available text on this subject it is intended to fulfill several needs Machine Learning - EWSL-91 Yves Kodratoff,1991-02-20 In this book contemporary knowledge of superconductivity is set against its historical background First the highlights of superconductivity research in the twentieth century are reviewed Further contributions then describe the basic phenomena resulting from the macroscopic quantum state of superconductivity such as zero resistivity the Meissner Ochsensfeld effect and flux quantization and review possible mechanisms including the classical BCS theory and the more recent alternative theories The main categories of superconductors elements intermetallic phases chalcogenides oxides and organic compounds are described Common features and differences in their structure and electronic properties are pointed out This broad overview of superconductivity is completed by a discussion of properties related to the coherence length Newcomers to the field who seek an overall picture of research in superconductivity and of the cross links between its branches will find this volume especially useful

Proceedings of the Fourth International Workshop on MACHINE LEARNING Pat Langley, 2014-05-12 Proceedings of the Fourth International Workshop on Machine Learning provides careful theoretical analyses that make clear contact with traditional problems in machine learning This book discusses the key role of learning in cognition Organized into 39 chapters this book begins with an overview of pattern recognition systems of necessity that incorporate an approximate matching process to determine the degree of similarity between an unknown input and all stored references This text then describes the rationale in the Protos system for relegating inductive learning and deductive problem solving to minor roles in support of retaining indexing and matching exemplars Other chapters consider the power as well as the appropriateness of exemplar based representations and their associated acquisition methods This book discusses as well the extensions to the way a case

Meyrowitz,Susan Chipman,2007-08-19 One of the most intriguing questions about the new computer technology that has appeared over the past few decades is whether we humans will ever be able to make computers learn As is painfully obvious to even the most casual computer user most current computers do not Yet if we could devise learning techniques that enable computers to routinely improve their performance

through experience the impact would be enormous The result would be an explosion of new computer applications that would suddenly become economically feasible e g personalized computer assistants that automatically tune themselves to the needs of individual users and a dramatic improvement in the quality of current computer applications e g imagine an airline scheduling program that improves its scheduling method based on analyzing past delays And while the potential economic impact of successful learning methods is sufficient reason to invest in research into machine learning there is a second significant reason studying machine learning helps us understand our own human learning abilities and disabilities leading to the possibility of improved methods in education While many open questions remain about the methods by which machines and humans might learn significant progress has been made Computational Models of Learning Leonard Bolc,2012-12-06

In recent years machine learning has emerged as a significant area of research in artificial intelligence and cognitive science At present research in the field is being intensified from both the point of view of theory and of implementation and the results are being introduced in practice Machine learning has recently become the subject of interest of many young and talented scientists whose bold ideas have greatly contributed to the broadening of knowledge in this rapidly developing field of science This situation has manifested itself in an increasing number of valuable contributions to scientific journals However such papers are necessarily compact descriptions of research problems Computational Models of Learning supplements these contributions and is a collection of more extensive essays These essays provide the reader with an increased knowledge of carefully selected problems of machine learning **Genetic Programming** John R. Koza,1992 In this ground breaking book John Koza shows how this remarkable paradigm works and provides substantial empirical evidence that solutions to a great variety of problems from many different fields can be found by genetically breeding populations of computer programs Genetic programming may be more powerful than neural networks and other machine learning techniques able to solve problems in a wider range of disciplines In this ground breaking book John Koza shows how this remarkable paradigm works and provides substantial empirical evidence that solutions to a great variety of problems from many different fields can be found by genetically breeding populations of computer programs Genetic Programming contains a great many worked examples and includes a sample computer code that will allow readers to run their own programs In getting computers to solve problems without being explicitly programmed Koza stresses two points that seemingly different problems from a variety of fields can be reformulated as problems of program induction and that the recently developed genetic programming paradigm provides a way to search the space of possible computer programs for a highly fit individual computer program to solve the problems of program induction Good programs are found by evolving them in a computer against a fitness measure instead of by sitting down and writing them *Scientific Data Mining and Knowledge Discovery* Mohamed Medhat Gaber,2009-09-19 Mohamed Medhat Gaber It is not my aim to surprise or shock you but the simplest way I can summarise is to say that there are now in the world machines that think that learn and that create

Moreover their ability to do these things is going to increase rapidly until in a visible future the range of problems they can handle will be coextensive with the range to which the human mind has been applied by Herbert A Simon 1916 2001

1 Overview This book suits both graduate students and researchers with a focus on discovering knowledge from scientific data The use of computational power for data analysis and knowledge discovery in scientific disciplines has found its roots with the revolution of high performance computing systems Computational science in physics chemistry and biology represents the first step towards automation of data analysis tasks The rationale behind the development of computational science in different areas was automating mathematical operations performed in those areas There was no attention paid to the scientific discovery process Automated Scientific Discovery ASD 1 3 represents the second natural step ASD attempted to automate the process of theory discovery supported by studies in philosophy of science and cognitive sciences Although early research articles have shown great successes the area has not evolved due to many reasons The most important reason was the lack of interaction between scientists and the automating systems
