The World Ocean Wilson, Gary Warren, 1971. Under pressure of more intensive and diverse uses the legal principle of Freedom of Access to marine resources is no longer sufficient to regulate man's activities in the marine environment. An analysis of the factors which must be considered in designing a workable regime for the future exploitation of the ocean was conducted. Oceanographic as well as political and economic factors are examined and alternative solutions evaluated as to their ability to satisfy various interests and objective considerations. A recommended formula for the delimitation of coastal state jurisdiction in ocean space and a proposed structure for an International Ocean Authority to regulate activities in the area beyond national jurisdiction are advanced.

During the past century scientists, world statesmen and international entrepreneurs have become increasingly aware of the potential of the oceans as a source of minerals. This book provides an authoritative picture of the current state of marine mineral extraction. A major work of reference, it will be essential reading for both those engaged in maritime studies and for professional organisations involved in the extraction of underwater minerals.

Oil in the 21st Century Robert Mabro, 2006. Oil is hitting the headlines once again. The big increases in oil prices over the past two years are upsetting consumers and puzzling producers. The reasons are difficult to understand since few people are familiar with the complex workings of the price regime for oil in international trade. It is said that sluggish investment is a major cause, but what are the reasons for inadequate investment in oil producing and refining plants during the last 20 years? Does oil have a future? We are told that oil production will soon peak because the rate of production is higher than replacement rates. Climate change problems are casting a shadow over the future of fossil fuels. There may however be a solution to the nefarious CO2 emissions, for instance technologies that sequester carbon. Oil's stronghold is the transport sector: cars, trucks, railway engines, planes, ships. The demand for oil would suffer a fatal blow if technical innovations in car engines make it possible to use an alternative fuel to petrol or diesel. New energy sources: wind, solar, tide waves, geo thermal, are both renewable and environment friendly. Do they represent a threat to the future of oil? An international team of experts addresses these highly topical questions in this comprehensive volume.
