Abstract

Purpose: This article provides an overview of current treatment options for adults and adolescents suffering from eating disorders (ED).

Views: ED are prevalent public health problems that considerably impair physical health and disrupt psychosocial functioning. In primary care settings, anorexia nervosa, bulimia nervosa, and binge eating disorder represent the most frequently seen types of eating disorders, in both adults and adolescents. To address these maladaptive eating-related behaviors and concurrent psychiatric symptoms, various pharmacological interventions and specialized psychological treatments have been evaluated and received support to varying degrees by controlled research.

Conclusions: The current literature regarding children and adolescents with eating disorders mainly supports the use of psychological interventions, such as family-based treatment and cognitive behavioral therapy. Due to the lack of robust evidence, the use of psychotropic medications is neither recommended nor approved in this population. For adults with eating disorders, an array of behaviorally focused psychotherapies, along with integrative and interpersonal approaches, can lead to the improvement of symptoms and the achievement of a healthy weight. Moreover, aside from psychotherapy, several pharmacological agents can contribute to the alleviation of eating disorders' clinical characteristics in the adult population. At the moment, the recommended psychotropic medication for eating disorders is represented by fluoxetine for bulimia nervosa and lisdexamfetamine for binge eating disorder.

Key words: anorexia nervosa, bulimia nervosa, binge eating disorder, medication, psychotherapy.

INTRODUCTION

Eating disorders (ED) are conditions characterized by abnormal eating behaviors and excessive preoccupation with food, body weight, and shape. ED stand out as particularly complex multifaceted psychiatric illnesses that can lead to multiple complications, with disruptions in cognitive, emotional, and social functioning [1]. The age at onset for ED is typically in adolescence and young adulthood [2], but a growing body of literature suggests that ED and body image concerns are also present in middle-aged and older women and men [3]. Whereas in other areas of psychiatry the use of psychotropic medication represents the center of the therapeutic management of the case, ED do not benefit from the same wide array of pharmacological agents that can alleviate the specific symptoms. At the moment, there is no medication approved for anorexia nervosa for adults or children and adolescents. Treatment literature supports the use of the

antidepressant fluoxetine and central nervous system stimulant, lisdexamfetamine, for bulimia nervosa and binge ED, but only in the adult population. Studies suggest that specialized psychotherapies can be efficient in reducing symptoms of ED, and for children and adolescents these approaches represent the first line of treatment recommended by the major guidelines [4].

RECOGNIZING AND DIAGNOSING EATING DISORDERS

The conceptualization of ED evolved rapidly over the last 10 years [5]. In the current version of the Diagnostic and Statistical Manual of Mental Disorders (DSM-5), the most significant changes are represented by the expansion of the ED chapter to "feeding and eating disorders", in which the feeding and ED of infancy or early childhood were added, along with the listing of binge eating disorder (BED) for the first time as a distinct
