## **New Targets In Cancer Chemotherapy:**

*Molecular Targets in Cancer Therapy* Anand Shankar Ramteke, Suresh Kumar Ramakrishnan, Rajesh Agarwal, 2025-06-23  
Cancer continues to be a major global health challenge. Recent breakthroughs in molecular biology and multi-omics technologies have revolutionized the understanding of disease pathology and treatment modalities. *Molecular Targets in Cancer Therapy* is a cutting-edge resource that explores the rapidly evolving landscape of targeted cancer treatments, offering critical insights into the molecular mechanisms driving tumors' growth and progression. This comprehensive book brings together contributions from leading cancer researchers who examine a wide range of molecular targets that are involved in hallmarks of cancer, i.e., cell signalling pathways, angiogenesis, cell death pathways, epithelial-mesenchymal transitions, telomerase, immune signalling, metabolic attributes, etc. Each chapter delves into the biological rationale, current therapeutic strategies, and clinical implications of targeting these molecules, offering readers both foundational knowledge and the latest advances in the field.

*Novel Anticancer Drug Protocols* John K. Buolamwini, Alex A. Adjei, 2008-02-01  
We are in an exciting era in the war against cancer with real prospects for novel anticancer drugs that are cancer-cell specific without the toxicities that have been the hallmark of conventional cytotoxic cancer chemotherapy. Advances in cancer cell biology, fueled by the molecular biology revolution, have resulted in the uncovering of many novel potential molecular targets for cancer therapy. New anticancer drug discovery and development is now largely focused on exploiting these new molecular targets, which encompass oncogenes, tumor suppressor genes, and their gene products, as well as targets involved in tumor angiogenesis, metastasis, survival, and longevity mechanisms. Exploitation of some of these targets has already yielded fruits and introduced new paradigms of molecularly targeted cancer therapy into the clinic, namely, protein kinase inhibition by antibodies or small molecules, exemplified by Herceptin (trastuzumab), a humanized antibody targeted against the HER2 growth factor receptor tyrosine kinase for the treatment of metastatic breast cancer, and Gleevec (imatinib), a small molecule bcr-abl kinase inhibitor for the treatment of chronic myelogenous leukemia.

**Targets for Cancer Chemotherapy** Nicholas B. La Thangue, Lasantha R. Bandara, 2002-04-03  
In *Targets for Cancer Chemotherapy*, Transcription Factors and Other Nuclear Proteins, a panel of leading basic researchers, pharmaceutical scientists, and clinical oncologists explain in detail the therapeutically relevant protein targets that contribute to cancer pathology and spell out their implications for cancer drug discovery and clinical application. The authors identify and illuminate selected transcription factor oncoproteins and tumor suppressors together with nuclear proteins that are central to the phenotype of the tumor cell involved in chromatin control. The emphasis is on new targets and approaches to cancer treatment derived from the cancer cell cycle, gene control, targets

Gardner,Zvi Kelman,2019-09-19 In all organisms the DNA replication machinery is responsible for accurate and efficient duplication of the chromosome Inhibitors of replication proteins are commonly used in anti cancer and anti viral therapies This eBook on The DNA Replication Machinery as Therapeutic Targets examines the normal functions of replication proteins as well as strategies to target each step during the replication process including DNA unwinding DNA synthesis and DNA damage bypass and repair Articles discuss current strategies to develop drugs targeting DNA replication proteins as well as future outlooks and needs
