## Sample size – Conf interval for a proportion

Sample size for a descriptive study of a dichotomous variable. This calculator gives both binomial and normal approximation to the sample size.

**Instructions:** Enter parameters in the **green** cells. Answers will appear in the blue box below.

P = 0.075 Expected proportion

W = 0.05 Total width of confidence interval

CL 95 % Confidence level

Calculate

### 1. Binomial "exact" calculation

Sample size = N = 467  
Expected positive results in sample = x = 35

### 2. Normal approximation to the binomial calculation

$\alpha = (1-CL)/2 = 0.025$   
Standard normal deviate for  $\alpha = Z_{\alpha} = 1.960$

Sample size = N =  $4Z_{\alpha}^2 P(1-P)/W^2 = 426$   
Expected positive results in sample = x = 32

**Small Clinical Trials** Institute of Medicine, Board on Health Sciences Policy, Committee on Strategies for Small-Number-Participant Clinical Research Trials, 2001-02-01 Clinical trials are used to elucidate the most appropriate preventive diagnostic or treatment options for individuals with a given medical condition Perhaps the most essential feature of a clinical trial is that it aims to use results based on a limited sample of research participants to see if the intervention is safe and effective or if it is comparable to a comparison treatment Sample size is a crucial component of any clinical trial A trial with a small number of research participants is more prone to variability and carries a considerable risk of failing to demonstrate the effectiveness of a given intervention when one really is present This may occur in phase I safety and pharmacologic profiles II pilot efficacy evaluation and III extensive assessment of safety and efficacy trials Although phase I and II studies may have smaller sample sizes they usually have adequate statistical power which is the committee's definition of a large trial Sometimes a trial with eight participants may have adequate statistical power statistical power being the probability of rejecting the null hypothesis when the hypothesis is false Small Clinical Trials assesses the current methodologies and the appropriate situations for the conduct of clinical trials with small sample sizes This report assesses the published literature on various strategies such as 1 meta analysis to combine disparate information from several studies including Bayesian techniques as in the confidence profile method and 2 other alternatives such as assessing therapeutic results in a single treated population e g astronauts by sequentially measuring

whether the intervention is falling above or below a preestablished probability outcome range and meeting predesigned specifications as opposed to incremental improvement
