### VI. CONCLUSION

This paper presents an alternative approach for FIR filter design using PSOCTFPA. Filters of orders 20 and 50 have been realized using GA as well as PSOCTFPA. Extensive simulation results justify that the proposed algorithm outperforms GA in the accuracy of the magnitude response of the filter as well as in the convergence speed.

*Brownian Agents and Active Particles* Frank Schweitzer, 2007-08-29 When we contemplate phenomena as diverse as electrochemical deposition or the spatial patterns of urban development it is natural to assume that they have nothing in common After all there are many levels in the hierarchy that builds up from atoms to human society and the rules that govern atoms are quite different from those that govern the geographical emergence of a city The common view among many if not most biologists and social scientists is that the devil is entirely in the details This school of thought asserts that social science and biology have little or nothing in common and indeed many biologists claim that even different fields of biology have little in common If they are right then science can only proceed by recording vast lists of details that no common principles will ever link together Physics in contrast has achieved a parsimonious description for a broad range of phenomena based on only a few general principles The phenomena that physics addresses are unquestionably much simpler than those of biology or social science and on the surface appear entirely dissimilar A cell is far more complicated than a pendulum or an atom and human society being built out of a great many cells is far more complicated still Cells and societies have many layers of hierarchical organization with complex functional and computational properties they have identities idiosyncracies stemming from an accumulation of historical contingency that makes them impossible to characterize in simple mathematical terms Their complexity is far beyond that of the simple systems usually studied in physics

gained on the fundamental interactions from the study of low energy systems In this kind of physics which is characterized experimentally by very intense particle sources and very sensitive apparatuses one can search for rare events and can perform precise measurements Sensitive tests of the predictions of current theories of electro weak and strong interactions can thus be achieved The course was attended by 54 participants from 23 institutes in 9 countries The morning lectures reviewed the achievements of the field in the last few years and the afternoon seminars dealt with new results and projects
