Biosynthesis and biodegradation of wood components

Takayoshi Higuchi, 2012-12-02 *Biosynthesis and Biodegradation of Wood Components* is a comprehensive account of the biosynthesis and biodegradation of wood and wood components. Topics covered range from the localization of polysaccharides and lignins in wood cell walls to the metabolism and synthetic function of cambial tissue along with the function of cell organelles in the biosynthesis of cell wall components. The biosynthesis of plant cell wall polysaccharides is also discussed. This book is comprised of 22 chapters and begins with an overview of the structure of wood with emphasis on three aspects of sections of wood: the cross or transverse section, the tangential section, and the radial section or face. The following chapters deal with the structure and chemistry of the major components of wood cell walls, the metabolism and synthetic function of cambial tissue, the function of organelles involved in biosynthesis, and the biosynthesis both of the major cell wall components of wood (cellulose, hemicelluloses, and lignins) and of wood extractives. The microbial degradation of cell wall components and aromatic extractives of wood is also considered together with the microorganisms involved in lignin biodegradation as well as the physiology and biochemistry of degradation by white rot fungi. This monograph will be of interest to biochemists as well as students and researchers in biochemistry.
