Technical Information Center,1976 *Proceedings* ,1976 The Relationship Between Damage and Localization Helen Lewis,G. D. Couples,2007 The many kinds of porous geomaterials rocks soils concrete etc exhibit a range of responses when undergoing inelastic deformation In doing so they commonly develop well ordered fabric elements forming fractures shear bands and compaction bands so creating the planar fabrics that are regarded as localization Because these induced localization fabrics alter the bulk material properties such as permeability acoustic characteristics and strength it is important to understand how and why localization occurs and how it relates to its setting The concept of damage in several uses describes both the precursor to localization

and the context within which it occurs A key theme is that geomaterials display a strong material evolution during deformation revealing a close linkage between the damage and localization processes This volume assembles perspectives from a number of disciplines including soil mechanics rock mechanics structural geology seismic anisotropy and reservoir engineering The papers range from theoretical to observational and include contributions showing how the deformed geomaterial s emergent bulk characteristics like permeability and seismic anisotropy can be predicted The Mechanical Behavior of Salt – Understanding of THMC Processes in Salt Manfred Wallner,Karl-Heinz Lux,Wolfgang Minkley,H.
