## **Molecular Approaches To Heart Failure Therapy:**

**Molecular Approaches to Heart Failure Therapy** G. Hasenfuss, E. Marban, 2012-12-06 G HASENFUSS E MARBAN  
Heart failure embodies the central irony of modern medicine As we have become increasingly adept at treating the major proximate causes of death in Western society we have effectively converted acute illness into chronic malady The last twenty years have witnessed a revolution in the treatment of acute coronary syndromes myocardial infarction in particular Patients who reach the hospital now have every expectation of leaving alive but not necessarily well Our ability to blunt the edge of ischemic insults has engendered new problems a new cohort of patients whose hearts function well enough to enable short term survival but at the cost of decreased exercise tolerance dyspnea and increased long term mortality The irony is compounded by our increasingly sophisticated pharmacopeia for the treatment of heart failure which by slowing the progression of ventricular dysfunction has created a chronic illness The fact of its chronicity makes heart failure no less deadly In symptomatic patients mortality exceeds 5-10% per year even with the best contemporary therapy Not all heart failure is ischemic of course but the final common phenotype is eerily concordant regardless of the proximate cause No wonder then that heart failure is the leading cause of hospitalization in America and in Western Europe and that the prevalence of the disease continues to rise Drugs have indeed revolutionized heart failure therapy ACE inhibitors and beta adrenergic blockers having the most outstanding records to date

lineages and differentiation It is not naive to think that within a decade or so our overall understanding of stem cell biology will be as revolutionized as it was when the pioneering hemopoietic stem cell studies of Till and McCulloch in Toronto captured our imaginations in 1961 With it will come better methods for ES and lineage specific stem cell identification maintenance and controlled fate selection Clearly ES cell models are already providing opportunities for the establishment of limitless sources of specific cell populations In recognition of the growing excitement and potential of ES cells as models for both the advancement of basic science and future clinical applications I felt it timely to edit this collection of protocols Embryonic Stem Cells in which forefront investigators would provide detailed methods for use of ES cells to study various lineages and tissue types
