

Human Molecular Genetics- Understanding Chromosome Structure and Function

Located inside the nucleus of plant and animal cells, chromosomes have unique thread-like structure, made of protein, called histones and a single molecule of deoxyribonucleic acid (DNA). The name *chromosome* comes from two Greek words – *chroma* (colour) and *soma* (body).

For a living organism to develop and function the right way, cells constantly divide into new cells and replace the old ones. During this process, it is indispensable for DNAs to remain intact to be evenly distributed among cells. Chromosomes ensure that DNA is properly copied and distributed during this vast range of cell divisions.

Pic 1: Structure of Chromosome

Even minor changes in structure and number of chromosomes during the formation of new cells can lead to serious issues. For example, in human body, cancer is caused by faulty chromosomes, which are made up of broken chromosomes. The same is for the reproductive cells, like eggs or sperms to have the right number and structure of chromosomes. Otherwise, the offspring will not grow properly. For example, children with Down syndrome have 3 copies of chromosome 21 instead of 2 copies found in normal babies.
