Molecular Designing Of Materials Devic:

The Molecular Designing of Materials and Devices Massachusetts Institute of Technology. Laboratory for Insulation Research, Arthur Robert Von Hippel, 1965-01 Nature designs everything from atoms hence we should be able to create any feasible kind of material and device with foresight if we understood the Periodic System in all its implications Yet like weather forecasters we find ourselves still members of the gambling profession This was the tenor of the third summer session on modern materials research sponsored by the Laboratory for Insulation Research at MIT in 1963 Its program organized by Arthur R von Hippel Institute Professor and one of the pioneers of modern materials research ranged from the electronic structure of atoms and molecules to the design patterns and operating mechanisms of living systems The participants came from a gamut of professions and the course seemed threatened by a confusion of tongues instead the two weeks of learning and debating proved so full of interest and enjoyment that the majority of the lecturers voted for a joint publication of their contributions Thus this volume on *The Molecular Designing of Materials and Devices* joins its three predecessors *Dielectrics and Waves* *Dielectric Materials and Applications* and *Molecular Science and Molecular Engineering* already established as classics in their fields This volume advances its theme in three stages from the architecture of materials to the properties produced by structures and compositions and to the devices employing such properties with increasing sophistication Since this vast panorama is conjured by twenty five experts with highly individual outlooks an extensive survey traces the problems and thoughts that connect chapter to chapter The text is supported by a great number of illustrations and a comprehensive index gives additional unity and long range usefulness to the presentation The contributors are Ali S Argon David J Epstein John B Goodenough Shinya Inou Thomas A Kaplan Hendrik A Kasens Helen D Megaw Erwin W M Heinz Raether Gert W Rathenau Albert Rose Murray D Rosenberg Walter A Rosenblith Heinz Schlicke Francis O Schmitt James H Schulman John C Slater Alexander Smakula Edward V Somers S Donald Stookey Morris Tanenbaum Albert von Engel Arthur von Hippel Carl Wagner Herbert Zeiger and Clarence Zener *Molecular Designing of Materials and Devices* Arthur Von Hippel (ed), 1965 [The Molecular Designing of Materials and Devices](#) Arthur R. Organic Light-Emitting Materials and Devices Zhigang Li, Zhigang Rick Li, Hong Meng, 2006-09-12 New advances offer flexible low cost fabrication methods for light emitting materials particularly in display technologies As researchers continue to develop novel applications for these materials feasible solutions for large scale manufacturing are increasingly important Organic Light Emitting Materials and Devices covers all aspects of

A New Generation of Organic Light-Emitting Materials and Devices Shi-Jian Su, Lian Duan, Hisahiro Sasabe, 2019-11-27 Since the invention of the first efficient organic light emitting diodes OLEDs by C T Tang and S VanSlyke OLEDs have attracted close interest as a promising candidate for next generation full color displays and future solid state lighting sources because of a number of advantages like high brightness and contrast high luminous efficiency fast response time wide viewing angle low power consumption and light weight The recombination of holes and electrons under electrical excitation typically generates 25% singlet excitons and 75% triplet excitons For traditional fluorescent OLEDs only 25% singlet excitons can be utilized to emit light while the other 75% triplet excitons are generally wasted through nonradiative transition By adopting noble metal phosphorescent complexes an internal quantum efficiency IQE of 100% could be achieved by utilizing both the 25% singlet excitons and 75% triplet excitons However these phosphors usually contain nonrenewable and highcost iridium or platinum noble metals Most recently unity IQE has been readily achieved through noble metal free purely organic emitters such as thermally activated delayed fluorescence TADF emitters hybridized local and charge transfer state HLCT hot exciton emitters binary or ternary mixed donor acceptor exciplex emitters and neutral p radical emitters etc In addition the combination of conventional p type hole transport and n type electron transport materials in an appropriate device structure can also provide an uncommon efficiency Both strategies are essential and attractive for high performance and low cost full color displays and white OLED applications This Research Topic mainly focus on this new generation of organic light emitting

materials and devices including design synthesis and characterization of light emitting organic molecules with tunable excited states and their structural electrical and photophysical properties Contributions relating to carrier transporting materials and corresponding device engineering are also included Two mini reviews and thirteen original research articles by recognized academic experts in their respective fields are collected in this Research Topic which will offer a broad perspective of noble metal free organic light emitters including conventional fluorescent emitters TADF emitters HLCT emitters exciplex emitters aggregation induced emission AIE luminogens and their corresponding devices We believe this eBook should attract the attention of multidisciplinary researchers in the fields of materials science organic synthesis and electronic device engineering especially for those engaged in OLED related areas [Electrochromic Materials and Devices](#)

Roger J. Mortimer, David R. Rosseinsky, Paul M. S. Monk, 2015-10-26 Electrochromic materials can change their properties under the influence of an electrical voltage or current Different classes of materials show this behavior such as transition metal oxides conjugated polymers metal coordinated complexes and organic molecules As the color change is persistent the electric field needs only to be applied to initiate the switching allowing for applications such as low energy consumption displays light adapting mirrors in the automobile industry and smart windows for which the amount of transmitted light and heat can be controlled The first part of this book describes the different classes and processing techniques of electrochromic materials The second part highlights nanostructured electrochromic materials and device fabrication and the third part focuses on the applications such as smart windows adaptive camouflage biomimicry wearable displays and fashion The last part rounds off the book by device case studies and environmental impact issues [Functional materials with Charge Transfer Properties and Their Application in Photoelectric Devices](#)
