Molecular Mechanisms of Enzyme Action Nomura Sōgō Kenkyūjo, 1966 Molecular Mechanisms of Enzyme Adaptation to Temperature and Pressure Philip Stewart Low, 1975 **Molecular Mechanism of Steroid Hormone Action** Virinder K. Moudgil, 2011-06-24 No detailed description available for Molecular Mechanism of Steroid Hormone Action Molecular Mechanisms and Physiological Significance of Organelle Interactions and Cooperation Michael Schrader, Markus Islinger, 2017-02-28 Eukaryotic cells contain distinct membrane bound organelles which compartmentalise cellular proteins to fulfil a variety of vital functions Many organelles have long been regarded as isolated and static entities e g peroxisomes mitochondria lipid droplets but it is now evident that they display dynamic changes interact with each other share certain proteins and show metabolic cooperation and cross talk Despite great advances in the identification and characterisation of essential components and molecular mechanisms associated with the biogenesis and function of organelles information on how organelles interact and are incorporated into metabolic pathways and signaling networks is just beginning to emerge Organelle cooperation requires sophisticated targeting systems which regulate the proper distribution of shared proteins to more than one organelle Organelle motility and membrane remodeling support organelle interaction and contact This contact can be mediated by membrane proteins residing on different organelles which can serve as molecular tethers to physically link different organelles together They can also contribute to the exchange of metabolites and ions or act in the assembly of signaling platforms In this regard organelle communication events have been associated with important cellular functions such as apoptosis antiviral defense organelle division biogenesis ROS metabolism and signaling and various metabolic pathways such as breakdown of fatty acids or cholesterol biosynthesis In this research topic we will focus on recent novel findings on the underlying molecular mechanisms and physiological significance of organelle interaction and cooperation with a particular focus on mitochondria peroxisomes endoplasmic reticulum lysosomes and lipid droplets and their impact on the regulation of cellular homeostasis Our understanding of how organelles physically interact and use cellular signaling systems to coordinate functional networks between each other is still in its infancy Nevertheless recent discoveries of defined membrane structures such as the mitochondria ER associated membranes MAM are revealing how membrane domains enriched in specific proteins transmit signals across organelle boundaries allowing one organelle to influence the function of another In addition to its role as a mediator between mitochondria and the ER contacts between the MAM and peroxisomes contribute to antiviral signaling and specialised regions of the ER are supposed to initiate peroxisome biogenesis whereas intimate contacts between peroxisomes lipid droplets and the ER mediate lipid metabolism In line with these observations it is tempting to speculate that further physical contact sites between other organelles exist Alternatively novel regulated vesicle trafficking pathways between organelles e g mitochondria to peroxisomes or lysosomes have been discovered implying another mode of organelle communication Identifying the key molecular players of such specialised membrane

structures will be a prerequisite to understand how organelle communication is physically accomplished and will lead to the identification of new regulatory networks. In addition to the direct transmission of interorganellar information, cytosolic messenger systems e.g. kinase phosphatase systems or redox signaling may contribute to the coordination of organelle functions. This research topic will integrate new findings from both modes of communication and will provide new perspectives for the functional significance of cross talk among organelles. We would like to thank all the researchers who contributed their valuable work to this research topic. Furthermore, we are grateful to the reviewers and Associate Editors who contributed valuable comments and positive criticism to improve the contributions.

Molecular Mechanisms of Alcohol
 Grace Y. Sun, P. Kevin Rudeen, W. Gibson Wood, Yau Huei Wei, Albert Y. Sun, 2012-12-06
 Alcohol abuse throughout the world is associated with serious social and medical implications. Problems such as intoxication, tolerance, and development of physical dependence have been well recognized. The central nervous system and the liver are especially affected. There is little doubt that alcohol abuse can result in organ damage which in turn leads to deleterious health consequences to the individual. Understanding ethanol action presents a special and functional diverse challenge because of its molecular simplicity. In fact, the ability for alcohol to disrupt cellular function is attributed to its cellular injury without regard to an apparent specific mechanism of action. Nevertheless, the key to an effective treatment to this problem is through research into understanding the mechanisms underlying how ethanol interacts with cells and membranes. This book is the result of a cooperative effort among scientists from many nations who met in a symposium in Taipei, Taiwan, ROC, July 1988. The focus of this book is on experimental approaches to better understand the molecular mechanisms of ethanol on the biological system. These recent advances in the examination of the alcohol effects on cellular function are divided into four sections. The first section addresses specific actions of ethanol on the central nervous system. The second section is directed to the use of cell cultures in ethanol research and the usefulness of cell cultures in examination of the effects of ethanol in vitro.

Molecular Mechanisms of Cardiac Hypertrophy and Failure Richard A. Walsh,2005-11-29 This title reviews current knowledge of the mechanisms contributing to heart failure Editor Richard Walsh and an internationally renowned team of contributors discuss key advances in molecular and cell biology biochemistry and pharmacology focusing on advances that have a direct bearing on current clinical studies It highlights developments across a broad range of disciplines with in depth coverage of each topic providing background and perspective on current literature By setting new advances in a broader context this text allows readers to compare different ideas and evaluate their importance in their own areas of research or clinical practice Physiological and Molecular Mechanisms of Important Agronomic Traits in Plants Under Various Abiotic Factors Dongmei Li,Dominik K. Großkinsky ,Weiwei Zheng,Zhibo Wang,2024-10-30 Plants live in environments influenced by various abiotic factors that can cause diverse stresses for example because of low or high temperature deficient or excessive water high salinity heavy metals and ultraviolet radiation etc These abiotic stresses are hostile to plant growth and development leading to great fruit quality and crop yield penalties worldwide especially under the global climate change Facing the numerous abiotic stresses plants have developed strategies to protect themselves in evolution The elucidation of their effects and underlying mechanisms is of great significance as a fundamental principle to relieve the pressure of environmental changes and to meet the demand of human population growth Up to date scientific efforts are welcome to be

delivered into this topic for a comprehensive understanding of the physiological and molecular effects of diverse abiotic stresses on plants ranging from model species to economically important crops The newly identified and characterized mechanisms and genetics associated with plant adaptability to abiotic stress will provide novel insights into the physiological and molecular alterations of plants under abiotic stresses It will assist in understanding plants behavior adapting to the environmental change and perspective agricultural practice including crop breeding and field management and eventually help maintain the food security safety and sustainability In addition increasing evidence shows that the recent advancements and developments of plant biotechnologies and application of big data to the area of plant science promote the understanding of the physiological and molecular effects of diverse abiotic stresses on plants Hence the investigations integrated by multidisciplinary approaches are strongly encouraged including but not limited to CRISPR Cas mediated gene editing functional genomics phenomics and high throughput phenotyping etc
