Medical Biochemistry has been streamlined to focus on only the most essential biochemical concepts important to medical students. The authors present facts and pathways to emphasize how the underlying biochemistry is related to the body's overall physiological functions. This text presents patients to the students as the biochemistry is being discussed, which strengthens the link between biochemistry and medicine and allows the student to learn about this interaction as the biochemistry is presented. Each chapter includes clinical and biochemical notes and comments, questions and answers to encourage further thinking and suggested references for those who would like to pursue a particular topic in more depth.

Regulation of Organelle and Cell Compartment Signaling Ralph A. Bradshaw, Edward A. Dennis, 2011-04-12 Cell signaling, which is also often referred to as signal transduction or, in more specialized cases, transmembrane signaling, is the process by which cells communicate with their environment and respond temporally to external cues that they sense there. All cells have the capacity to achieve this to some degree, albeit with a wide variation in purpose, mechanism, and response. At the same time, there is a remarkable degree of similarity over quite a range of species, particularly in the eukaryotic kingdom, and comparative physiology has been a useful tool in the development of this field. The central importance of this general phenomenon—sensing of external stimuli by cells—has been appreciated for a long time, but it has truly become a dominant part of cell and molecular biology research in the past three decades, in part because a description of the dynamic responses of cells to external stimuli is, in essence, a description of the life process itself. This approach lies at the core of the developing fields of proteomics and metabolomics, and its importance to human and animal health is already plainly evident. Provided by publisher.
