Double Photoionisation Spectra of Molecules John H. D. Eland, Raimund Feifel, 2018 This is the first ever compendium of double photoionisation spectra covering some 70 of the most important small and medium sized molecules and thus providing an essential starting point for studies of the consequences of ionisation by high energy photons in both terrestrial and astrophysical environments It also provides a complete non mathematical description of all the phenomena and pathways involved in molecular double photoionisation Most spectra are presented with identification of the electronic states and leading orbital configurations The technique of magnetic bottle time of flight electron spectroscopy used for all the spectra is fully explained and compared with other techniques For each molecule the book gives full references to relevant work by complementary techniques and to theoretical calculations Written in a clear non mathematical style this book is accessible to students as well as more experienced researchers The authors have designed the layout for easy retrieval of any desired spectrum through the systematic organisation and ordering of the compounds and thorough indexing As well as being a compendium of spectra the book is a textbook covering all the known phenomenological aspects of molecular double photoionisation The important phenomena are first mentioned in the introductory chapters and are discussed in more detail in connection with the groups of molecules and individual cases where they are most relevant The most useful spectra will be available in digital form for users

Sacred Geometry Stephen Skinner, 2009 A fascinating and inspirational look at the vital link between the hidden geometrical order of the universe geometry in nature and the geometry of the man made world The Da Vinci Code has awakened the public to the powerful and very ancient idea that religious truths and mathematical principles are intimately intertwined Sacred Geometry offers an accessible way of understanding how that connection is revealed in nature and the arts Over the centuries temple builders have relied on magic numbers to shape sacred spaces astronomers have used geometry to calculate holy seasons and philosophers have observed the harmony of the universe in the numerical properties of music By showing how the discoveries of mathematics are manifested over and over again in biology and physics and how they have inspired the greatest works of art this illuminating study reveals the universal principles that link us to the infinite

Vleck contact transformation method described in Volume 1 is applied in the calculation and analysis of IR transitions between vibration rotation energy levels The extended Lakhlii Dahoo substitution model is used in the framework of Liouville s formalism and the line profiles of triatomic molecules and their isotopologues subjected to environmental constraints are calculated by applying the cumulant expansion The applications presented in this book show how interactions at the molecular level modify the infrared spectra of triatomics trapped in a nano cage substitution site of a rare gas matrix clathrate fullerene zeolite or adsorbed on a surface and how these interactions may be used to identify the characteristics of the perturbing environment
