Molecules in Time and Space Miguel Vicente, Javier Tamames, Alfonso Valencia, Jesús Mingorance, 2004-07-02 During the last decade a wealth of new data has arisen from the use of new fluorescent labelling techniques and the sequencing of whole microbial genomes One important conclusion from these data is that bacterial cells are much more structured than previously thought The wall and the outer membrane contain topological domains some proteins localize or move in specific patterns inside the cells and some genes appear clustered in the chromosome and form conserved evolutionary units Many of these structures are related to the cell cycle and to the process of cell morphogenesis two processes that are themselves related to each other From these observations the dcw gene cluster appears as a phylogenetic trait that is mainly conserved in bacilli *Molecules in Time and Space* reviews the data on the formation of subcellular patterns or structures in bacteria presents observations and hypotheses on the establishment and the maintenance of cell shape and on the organization of genetic information in the chromosome

Genome Chaos Henry H. Heng, 2019-05-25 Genome Chaos Rethinking Genetics Evolution and Molecular Medicine transports readers from Mendelian Genetics to 4D genomics building a case for genes and genomes as distinct biological entities and positing that the genome rather than individual genes defines system inheritance and represents a clear unit of selection for macro evolution In authoring this thought provoking text Dr

Heng invigorates fresh discussions in genome theory and helps readers reevaluate their current understanding of human genetics evolution and new pathways for advancing molecular and precision medicine Bridges basic research and clinical application and provides a foundation for re examining the results of large scale omics studies and advancing molecular medicine Gathers the most pressing questions in genomic and cytogenomic research Offers alternative explanations to timely puzzles in the field Contains eight evidence based chapters that discuss 4d genomics genes and genomes as distinct biological entities genome chaos and macro cellular evolution evolutionary cytogenetics and cancer chromosomal coding and fuzzy inheritance and more
