Poleward Flows Along Eastern Ocean Boundaries Steven J. Neshyba, Christopher N.K. Mooers, Robert L. Smith, Richard T. Barber, 2013-03-07 In this paper differences and anomalies in west coast seasonal flow structures have been highlighted In particular it was emphasized that flow off Washington has significant differences from that of Oregon namely during summer flow at mid shelf is more poleward off Washington and during winter flow on the inner shelf is more equatorward off Washington than off Oregon The former result may be related to the poleward decrease in the longshelf wind stress the latter result may be related to the presence of the Columbia River plume Off southern California the near surface flow over the shelf is more persistently equatorward than that off Washington Conversely the flow over the slope in the upper 100 m of the water column is more persistently poleward than that off Washington Also the undercurrent structure that is a subsurface maximum is maintained at least from summer to early winter off southern California no data are yet available from spring but only during summer and early fall off Washington We note that the seasonal cycle of vertical shear in the two locations is similar although a reversal in sign sometimes occurs off Washington **ACKNOWLEDGEMENTS** This work was supported by the Department of Energy under Grant DE FG05 85ER60333t4 and by the National Science Foundation under Grant OCE 86 01058 1 175 From Adriana Huyer College of Oceanography Oregon State University Corvallis OR On Review and Commentary to paper **POLEWARD FLOW NEAR THE NORTHERN AND SOUTHERN BOUNDARIES OF THE U S WEST COAST** by Barbara Hickey **Ocean Circulation and Climate** P. Ted Strub, Vincent Combes, Frank A. Shillington, Oscar Pizarro, 2013-10-22 In this chapter we review the physical processes that create the mean and variable circulation features along the eastern margins of the ocean basins Rather than describing the individual systems we describe the processes and their variability between the systems dividing the discussion into the low mid and high latitude regions We start with the low latitudes since their signals often move poleward along the coastal wave guides into the midlatitudes which are the well known eastern boundary upwelling systems Our treatment of the higher latitudes is limited to examples from the better studied NE Pacific Basin The Alaska Current **Ocean Circulation and Climate**, 2013-10-22 The book represents all the knowledge we currently have on ocean circulation It presents an up to date summary of the state of the science relating to the role of the oceans in the physical climate system The book is structured to guide the reader through the wide range of world ocean circulation experiment WOCE science in a consistent way Cross references between contributors have been added and the book has a comprehensive index and unified reference list The book is simple to read at the undergraduate level It was written by the best scientists in the world who have collaborated to carry out years of experiments to better understand ocean circulation Presents in situ and remote observations with worldwide coverage Provides theoretical understanding of processes within the ocean and at its boundaries to other Earth System components Allows for simulating ocean and climate processes in the past present and future using a hierarchy of physical

Current with Rafos Floats Kirk R. Benson, 1995 This study presents float observations from four RAFOS floats that were deployed off central California for a twenty three day period as part of a Tomography Demonstration Experiment These floats

which sampled hourly were used to investigate float characteristics and the navigational accuracy of current processing techniques. An ordinary mean least square method is proposed to mathematically estimate values for random and systematic errors producing navigational trajectories which compliment previous methods when determining the most probable solution of the float trajectory. Potential sources of error in the navigational solution are examined as well as the importance of float source geometry on position accuracy. It was determined that these floats supported previous studies of the California Current System and proposes that the California Undercurrent may in fact be wider and deeper than previously suspected.
