Description

The field of atmospheric radiation and remote sensing has seen significant advances in recent years. This monograph addresses those advances and fills the need for an up-to-date, cohesive integration of radiative transfer and cloud physics, allowing for the better forecast of weather on medium and long-range levels. The author here offers a systematic discussion of the transfer of solar and thermal infrared radiation in the atmosphere, and of aspects of cloud processes pertinent to radiative transfer. The book focuses largely on the physical principles and approximations that are required to develop important topics in atmospheric radiation, cloud physics, and thermal equilibrium. Aspects of the interactions and feedbacks of radiation-cloud and dynamic and climate processes are discussed using a hierarchy of atmospheric models. Radiometric data obtained from the ground, the air, and space are frequently employed to illustrate physical processes in the atmosphere as well as to cross check theoretical results. The author also cogently discusses the application of the radiative transfer principle to remote sensing of atmospheric and cloud parameters. This book for the first time bridges the gap between cloud-radiation and dynamic processes in the atmosphere. It will be welcomed by meteorologists, earth scientists, and researchers interested in atmospheric modeling and radiation.

Reviews

"Liou discusses thoroughly the intricate interactions involving cloud and radiation processes in the atmosphere. Radiative transfer in clouds is covered here in more depth than it has been in other books. Many references and a good index add to the value of this book." -- *Choice*

"Published at a most welcome time. It provides a comprehensive summary of current scientific knowledge on atmospheric radiation, devoting special attention to cloud-radiative interactions. . . . written in an easily readable form with theoretical derivations presented in a clear and logical manner. It is recommended both as a useful text book for students of atmospheric radiation and as an important reference for scientists researching such problems." -- *Pure and Applied Geophysics*

"Makes a timely contribution to a subject that is central to current physical climate models. . . . covers a wide range of cloud interactions. . . . an admirably broad compendium of information. . . . a handy reference for researchers in the field." -- *Physics Today*

known as comparative planetology Based on an established course this comprehensive text covers a panorama of solar system bodies and their relevant general properties It explores the origin and evolution of atmospheres along with their chemical composition and thermal structure It also describes cloud formation and properties mechanisms in thin and upper atmospheres and meteorology and dynamics Each chapter focuses on these atmospheric topics in the way classically done for the Earth s atmosphere and summarizes the most important aspects in the field The study of planetary atmospheres is fundamental to understanding the origin of the solar system the formation mechanisms of planets and satellites and the day to day behavior and evolution of Earth s atmosphere With many interesting real world examples this book offers a unified vision of the chemical and physical processes occurring in planetary atmospheres Ancillaries are available at www.ajax.ehu.es/planetary_atmospheres

The Stratosphere and Its Role in the Climate System Guy P. Brasseur, 2013-06-29 This book presents a summary of the lectures given at the NATO Advanced Science Institute ASI which took place at Val Morin Quebec Canada 4-15 September 1995 This summer school offered an excellent opportunity to discuss key scientific questions related to the stratosphere and its importance for the climate system Approximately 85 students and 15 lecturers from 19 nations attended the ASI which was sponsored by SPARC Stratospheric Processes and Their Role in Climate a project of the World Climate Research Programme The purpose of the ASI was to present truly tutorial lectures rather than highly specialized or technical talks At the conference mornings were devoted to fundamental presentations while short illustrative talks were given in the afternoon The book presents a summary of the two types of lectures We were fortunate to enlist the participation of outstanding experts in the field of atmospheric science and excellent teachers Students were strongly encouraged to actively participate in various activities during the summer school for example the students were asked to summarize the lectures given by the teachers and in most cases the chapters presented in this book were written by small groups of students and reviewed by the lecturers During the school students had also the opportunity to present posters that described their personal research These lecture notes are divided into three major parts
