

Physiology of respiration

The process of gas exchange in the body, called **respiration**, it has three basic steps:

1. Pulmonary ventilation or breathing

- It is the inhalation (inflow) and exhalation (outflow) of air and involves the exchange of air between the atmosphere and the alveoli of the lungs.

2. External (pulmonary) respiration

- It is the exchange of gases between the alveoli of the lungs and the blood in pulmonary capillaries across the respiratory membrane.
- In this process, pulmonary capillary blood gains O_2 and loses CO_2 .

3. Internal (tissue) respiration

- It is the exchange of gases between blood in systemic capillaries and tissue cells. In this step the blood loses O_2 and gains CO_2 . Within cells, the metabolic reactions that consume O_2 and give off CO_2 during the production of ATP are termed *cellular respiration*

West, 2013-05-27 Present day respiratory physiology stems largely from the explosion of ideas which took place during and after World War II A number of the major players are still active but the opportunity to prepare a personal history of this branch of medicine will soon be lost In a sense then this book offers an exceptional even unique opportunity We are offered a first hand chronicle of the advancements made in respiratory physiology in the course of this century by one of the principal figures in the field The volume covers every aspect of the evolution of this important area of knowledge morphology gas exchange and blood flow mechanics control of ventilation and comparative physiology Some of the chapters are personal accounts of the development of respiratory physiology as observed by the author It is hoped that what is lost in objectivity by this approach is more than made up by the captivating insights provided by the author into the process of scientific research and discovery **Respiratory Physiology** Alan R. conventional wisdom In this text I have attempted to start from fundamental principles of biology chemistry and physics and ask at each step Does it make sense The mechanisms and structures of gas exchange exist because scientifically and logically they can t not be as they are The nature of our environment and the capabilities of living tissue are such that only certain opportunities have been available to the evolution of gas exchange
