Respiratory Muscles In Chronic Obstructive Pulmonary Disease:

Respiratory Muscles in Chronic Obstructive Pulmonary Disease A. Grassino, C. Fracchia, C. Rampulla, L. Zocchi, 2013-03-14 While emphysema and chronic bronchitis are primarily lung diseases one of their major consequences is to deeply affect the function of the respiratory muscles Lung hyperinflation shortens the inspiratory muscles due to increased airways resistance more of their effort is demanded and changes in nutritional status weaken them further Their malfunction can lead to severe dyspnea and to failure of the ventilatory pump Over the last 10 years we have witnessed an explosion of information of how respiratory muscles function in health and disease new techniques for their evaluation have been created the concept of fatigue weakness and failure was developed and their rest or training was attempted The implication of respiratory muscles malfunction in respiratory medicine has reached a prominent place It seems remarkable that while some aspect of skeletal muscles function requires molecular biology techniques to find new answers we still know little on respiratory muscles interaction strategies of coordination their role in dyspnea chronic hypercapnia or how to effectively improve their function in patients This workshop was organized and held at the Medical Center of Rehabilitation in Montescano and represents an attempt to focus on how the newly acquired wealth of information can eventually be transformed into medical care The participants in this workshop brought forward challenging thoughts and we are most grateful for their participation This book represents a report of the proceedings and also provides the most updated information in this field

Management of Chronic Obstructive Pulmonary Disease N.M. Siafakas, 2006-12-01 Since the 1970s therapeutic nihilism has moved towards a more optimistic attitude regarding therapeutic alternatives in COPD Research focused on inflammatory and physiological mechanisms has substantially increased during the last 10 years This has led to an increased understanding of the pathophysiology of the disease which has resulted in improved treatment Thus in parallel to smoking cessation programmes other treatment modalities have been shown to be successful Physiotherapy and pharmacotherapy have been extensively studied and the knowledge regarding what these therapeutic approaches
