

AQA A Revision Guide – The Restless Earth

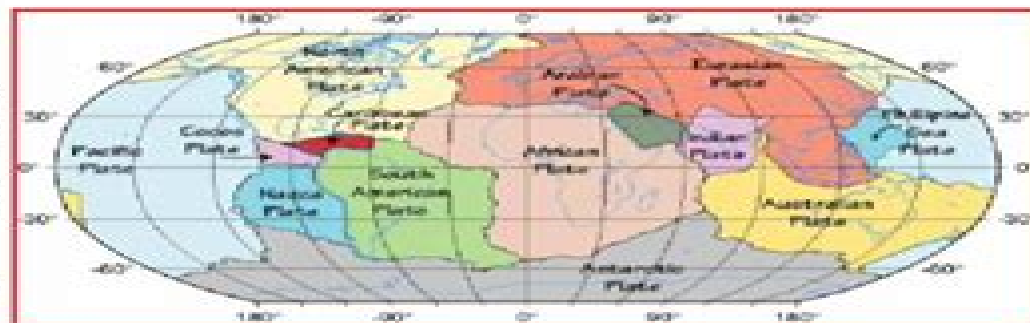

1. Why do we get volcanoes and earthquakes?

It is all to do with **PLATE TECTONICS**. This is a relatively new theory (only really been around for 100 years and been universally accepted for the last 40-50 years) and it looks at the structure of the Earth and examines how vast areas of rock or **PLATES** can move. To understand this theory you need to have an idea of the structure of the Earth. The diagram on the right shows this. The crust floats on the semi-molten rocks of the Mantle. The high temperatures in the Mantle result in convection currents that enable the crust to move.

2. Is the Crust just one piece?

NO! It is split up into a series of **PLATES** which fit together like a giant jigsaw. The map on the left shows this—note the underlying land masses in blue. You can see that we are on the Eurasian plate!

3. Are all these plates made of the same material?

No! Some are made of *continental* crust and some are made of *oceanic* crust. It is important to understand this as this will help you understand what happens at the different plate boundaries. This table summarises the differences:

Data / Type	Oceanic crust	Continental crust
Crust depth	shallow , 5 - 12 km	deeper , average 40km, 75km beneath young mountain range
Age	Young rocks, less than 200 Million years old	Older, generally over 1500 Million years
Density	$3.0 \times 10^3 \text{ Kg m}^{-3}$ DENSE!	$2.6 \times 10^3 \text{ Kg m}^{-3}$ NOT AS DENSE AS OCEANIC CRUST!
Rock type, geology	Mainly basalt	Range of granites with thin covering of sedimentary rocks

4. So what happens when the plates meet?

It depends! As I have already said it is determined by the type of crust involved, but also in terms of the direction in which the plates are moving. The different types of plate boundary are discussed on the next page.

The Rise and Fall of the Southern Alps Glen Coates, 2002 The Southern Alps Ka Tiritiri o te Moana are New Zealand s largest structural feature Running north and south for most of the length of the South Island they cross the Roaring Forties and divide the island into two distinct regions east and west each with its own unique climate landscape and lifeforms In this new book geologist Glen Coates joins with the artist and author Geoffrey Cox to tell how the Alps were formed from ancient

marine sediments how they were uplifted to become mountains and how they are being eroded down to produce the spectacular landscape seen today in the South Island Even in just the past few million years vast blocks of land have been shunted incredible distances and today frequent earthquakes remind us that this is a restless part of the earth where mountain building is still in full swing Rivers and glaciers past and present carve out a multitude of valleys and ranges and wide plains have spread out at the mountains feet All this is told in vivid non technical language and copiously illustrated with colour photographs and artwork The result is a book suitable for use in schools and by all who take an interest in their landscape and heritage Audio Video Review Digest ,1989 **Plates** Roy A. Gallant,2003 Discusses plate tectonics the theory that the surface of the earth is always moving and the connection of this phenomenon to earthquakes and volcanoes
