Modular Construction And Partial Order Semantics Of Petri Nets:

Modular Construction and Partial Order Semantics of Petri Nets Walter Vogler, 1992 Petri nets are a well known model for parallel systems used for both applications and theoretical studies They can be used for specification modelling and analysis and offer a graphical representation and a clear view of concurrency For the design of large systems modular construction is indispensable and considerable effort has been spent on studying the modular construction of Petri nets This book studies the modular construction of nets and in particular the top down design of nets by action refinement Suitable behavior descriptions are presented and special care is taken to justify these descriptions by showing that they are necessary under reasonable specification requirements In particular it is shown that partial order semantics is necessary to support action refinement

Transactions on Petri Nets and Other Models of Concurrency II Wil M. P. van der Aalst, 2009-03-26 Transactions on Petri Nets and Other Models of Concurrency ToPNoC II These Transactions publish archival papers in the broad area of Petri nets and other models of concurrency ranging from theoretical work to tool support and industrial applications ToPNoC issues are published as LNCS volumes and hence are widely distributed and indexed This Journal has its own Editorial Board which selects papers based on a rigorous two stage refereeing process ToPNoC contains Revised versions of a selection of the best papers from workshops and tutorials at the annual Petri net conferences Special sections issues within particular subareas similar to those published in the Advances in Petri Nets series Other papers invited for publication in ToPNoC Papers submitted directly to ToPNoC by their authors The second volume of ToPNoC focuses on Concurrency in Process Aware Information Systems Although the topic of business process management using information technology has been addressed by consultants and software developers in depth more fundamental approaches towards such Process Aware Information Systems PAISs have been rather uncommon It wasn't until the 1990s that researchers started to work on the foundations of PAISs Clearly concurrency theory is an essential ingredient in these foundations as business processes are highly concurrent involving all types of routing logic and resource allocation mechanisms The 16 papers in this special issue of ToPNoC cover topics ranging from the formal mostly Petri net based foundations of PAISs to more applied topics such as flexibility and process mining Thus this volume gives a good overview of the state of the art in PAIS research

Modeling, Verification and Exploration of Task-Level Concurrency in Real-Time Embedded Systems Filip Thoen, Francky Catthoor, 2012-12-06 system is a complex object containing a significant percentage of electronics that interacts with the Real World physical environments humans etc through sensing and actuating devices A system is heterogeneous i.e. is characterized by the co-existence of a large number of components of disparate type and function for example programmable components such as micro processors and Digital Signal Processors DSPs analog components such as A/D and D/A converters sensors transmitters and receivers Any approach to system design today must include software concerns to be viable In fact it is now common knowledge that more than 70% of the development cost for complex systems such as automotive electronics and communication systems are due to software development In addition this percentage is increasing constantly It has been my take for years that the so called hardware software co design problem is formulated at a too low level to yield significant results in shortening design time to the point needed for next generation electronic devices and systems The level of abstraction has to be raised to the Architecture Function co design problem where Function refers to the operations that the system is supposed to carry out and

Architecture is the set of supporting components for that functionality The supporting components as we said above are heterogeneous and contain almost always programmable components

Ray Shooting, Depth Orders and Hidden Surface Removal Mark de Berg, 1993-08-30 Computational geometry is the part of theoretical computer science that concerns itself with geometrical objects it aims to define efficient algorithms for problems involving points lines polygons and so on The field has gained popularity very rapidly during the last decade This is partly due to the many application areas of computational geometry and partly due to the beauty of the field itself This monograph focuses on three problems that arise in three dimensional computational geometry The first problem is the ray shooting problem preprocess a set of polyhedra into a data structure such that the first polyhedron that is hit by a query ray can be determined quickly The second problem is that of computing depth orders we want to sort a set of polyhedra such that if one polyhedron is partially obscured by another polyhedron then it comes first in the order The third problem is the hidden surface removal problem given a set of polyhedra and a view point compute which parts of the polyhedra are visible from the view point These three problems involve issues that are fundamental to three dimensional computational geometry The book also contains a large introductory part discussing the techniques used to tackle the problems This part should interest not only those who need the background for the rest of the book but also anyone who wants to know more about some recent techniques in computational geometry

Formal Description Techniques IX R. Gotzhein, J. Brederke, 2016-01-09 This book is the combined proceedings of the latest IFIP Formal Description Techniques FDTs and Protocol Specification Testing and Verification PSTV series It addresses FDTs applicable to communication protocols and distributed systems with special emphasis on standardised FDTs It features state of the art in theory application tools and industrialisation of formal description

New Trends in Neural Computation José Mira, Joan Cabestany, Alberto Prieto, 1993-05-27 Neural computation arises from the capacity of nervous tissue to process information and accumulate knowledge in an intelligent manner Conventional computational machines have encountered enormous difficulties in duplicating such functionalities This has given rise to the development of Artificial Neural Networks where computation is distributed over a great number of local processing elements with a high degree of connectivity and in which external programming is replaced with supervised and unsupervised learning The papers presented in this volume are carefully reviewed versions of the talks delivered at the International Workshop on Artificial Neural Networks IWANN 93 organized by the Universities of Catalonia and the Spanish Open University at Madrid and held at Barcelona Spain in June 1993 The 111 papers are organized in seven sections biological perspectives mathematical models learning self organizing networks neural software hardware implementation and applications in five subsections signal processing and pattern
