**Drug Resistance As a Biochemical Target in Cancer Chemotherapy** Makoto Ogawa, 1991-11-12 Drug Resistance as a Biochemical Target in Cancer Chemotherapy covers the proceedings of the 13th Bristol Myers Squibb Symposium on Cancer Research entitled Drug Resistance as a Biochemical Target in Cancer Chemotherapy hosted by the Japanese Foundation for Cancer Research in Tokyo This book is divided into four parts encompassing 18 chapters that summarize the results of both preclinical and clinical research on circumvention of drug resistance The first two parts discuss the genetic aspects of multidrug resistance and the proteins involved in drug resistance These parts also examine the structure function and expression of P glycoproteins with an emphasis on the role of these proteins as targets for cancer chemotherapy The third part describes the methods for detection of P glycoprotein and its antagonists to counter clinical drug resistance This topic is followed by a discussion on the interactions among steroid hormones steroid hormone receptors antiandrogens biological response modifiers and cytotoxic drugs in human breast cancer The concluding part explores the clinical applications of chemosensitizers in cancer therapy This part also considers the alternative clinical approaches against drug failure including non cross resistant therapies autologous bone marrow transplantation dose intensive therapy and high dose chemotherapy Biomedical scientists and researchers and clinicians will find this book invaluable **New Drugs,**

**Concepts and Results in Cancer Chemotherapy** Franco M. Muggia, 1991-10-31 The decade of the 1990s will see an increasing emphasis on the modulation of chemotherapeutic drug selectivity and in the lock and key approach to new targets to control malignant proliferation The contents of this volume appropriately reflect these scientific undercurrents An emerging powerful tool of molecular pharmacology is described by Holcenberg and Wu Manipulation of genetic expression by modification of messenger RNA is now within our reach and the basic concepts are succinctly reviewed as a primer on future biochemical engineering of new anti cancer molecules Another concept that appears to be worthy of further study in both experimental and clinical chemotherapy concerns observations on the modulation of activity by the nucleoside transport inhibitor dipyridamole How potentiation of several anticancer drugs occurs has practical as well as theoretical ramifications discussed by Goel and Howell Finally O'Dwyer and La Creta present a fresh look at sensitization of chemotherapy by the hypoxic radiosensitizer SR 2731 *Gene Amplification in Mammalian Cells* Rodney E.

Kellems, 2020-08-26 Serves as a comprehensive review to the substantial impact of gene amplification in molecular biology genetic engineering and medical science The book covers the mechanism of gene amplification organization and structure of amplified genes *Cancer Treatment Reports*, 1986 **Mechanisms of Drug Resistance in Neoplastic Cells** Paul V.

Woolley, Kenneth D. Tew, 2013-10-22 Bristol Myers Cancer Symposia Volume 9 Mechanisms of Drug Resistance in Neoplastic Cells provides information on both basic scientific and clinical studies on the causes and implications of tumor cell resistance to common antineoplastic agents The book describes the colon cancer as a model for resistance to antineoplastic drugs

mathematical modeling of drug resistance and the mechanism of induced gene amplification in mammalian cells The text also discusses the cellular concomitants of multidrug resistance resistance to alkylating agents and the phosphoprotein and protein kinase C changes in human multidrug resistant cancer cells Novel drugs that affect glutathione metabolism the regulation of genes encoding drug metabolizing enzymes in normal and preneoplastic tissues and the relevance of glutathione S transferases to anticancer drug resistance are also considered The book further tackles the cellular resistance to cyclophosphamide the preclinical and clinical experiences with drug combinations designed to inhibit DNA repair in resistant human tumor cells and the modification of the cytotoxicity of DNA directed chemotherapeutic agents by polyamine depletion The text also demonstrates multidrug resistance and the circumvention of resistance Oncologists molecular biologists biochemists geneticists and pharmacologists will find the book invaluable

**Molecular Mechanisms and Their Clinical Application in Malignancies** Daniel E. Bergsagel, Tak W. Mak, 2013-10-22 Molecular Mechanisms and their Clinical Application in Malignancies is a collection of manuscripts presented at the 12th Annual Bristol Myers Squibb Symposium on Cancer Research held in Toronto Canada on September 26 27 1989 This symposium reviews the current understanding of the mechanisms of malignant transformation and the application of several technologies to the diagnosis evaluation and treatment of malignancies This book is divided into 14 chapters The opening chapters deal with the genetic basis of neoplasia and the molecular biology of oncogenes the regulation of transcription and the rearrangement of T and B cell genes during development and in malignancies The subsequent chapters focus on the genetic abnormalities detected in specific tumors such as retinoblastoma colorectal carcinoma and lung cancer These chapters also examine the retinoid and thyroid hormone receptors Other chapters explore the genetic basis of the cellular response to therapy drug resistance cachectin tumor necrosis factor in the biology of disease acute myelogenous leukemia and the stages in tumor progression The final chapters look into the application of molecular biology to clinical treatment in the form of receptor specific intoxication on tumor cells the molecular genetic analysis of the phakomycoses and the structural design of antitumor compounds This book will prove useful to oncologists molecular biologists clinicians and researchers

*Anticancer Drug Resistance* Lori J. Goldstein, Robert F. Ozols, 2012-12-06 Over the last 50 years drug development and clinical trials have resulted in successful complete responses in diseases such as childhood leukemia testicular cancer and Hodgkin's disease We are still however confronted with over 500 000 cancer related deaths per year Clearly the phenomenon of drug resistance is largely responsible for these failures and continues to be an area of active investigation Since the last volume in this series we have learned that the energy dependent drug efflux protein p glycoprotein encoded by the MDR 1 gene is a member of a family of structurally related transport polypeptides thus allowing us to explore the relationship between structure and function In addition to ongoing well designed clinical trials aimed at reversing MDR mediated drug resistance the first gene therapy studies with the MDR 1 gene retrovirally transduced into human bone marrow cells are about to be initiated

Although MDR is currently the most understood mechanism of drug resistance we are uncovering increasing knowledge of alternative molecular and biochemical mechanisms of drug resistance to antimetabolites cisplatin and alkylating agents and developing new strategies for circumventing such resistance It is clear that drug resistance is complex and many mechanisms exist by which cancer cells may overcome the cytotoxicity of our known chemotherapeutic agents As our understanding of each of these mechanisms expands well designed models will be necessary to test laboratory hypotheses and determine their relationship to drug resistance in humans It is this integration of basic science and clinical investigation that will both advance our scientific knowledge and result in the improvement of cancer therapy **Index of Conference**

**Proceedings Received** British Library. Lending Division,1981 **The Cytoskeleton** Thomas W. Clarkson,Polly R. Sager,Tore L.M. Syversen,2012-12-06 This book is based on reviews and research presentations given at the 16th Rochester International Conference on Environmental Toxicity entitled liThe Cytoskeleton A Target for Toxic Agents held on June 4 5 and 6 in 1984 The conference provided an in depth discussion of the effects a d mechanism of action of some toxic agents on the cytoskeleton Mammalian and other eukaryotic cells contain protein networks within the cytoplasm comprised of microfilaments intermediate Hlaments and microtubules These components of the cytoskeleton playa key role in cell shape motility intracellular organization and transport and cell division Furthermore the cytoskeleton via associations with the cell membrane appears to function in intracellular communication and cellular responses to membrane events Because of the complex functional roles of the cytoskeleton which vary with cell type degree of differentiation and cell cycle its disruption may result in a variety of cellular changes This expanding field in cell biology has already attracted the interest of toxicologists and environmental health scientists as a potentially fruitful area of research Indeed there is mounting evidence that certain toxic and chemotherapeutic compounds as well as physical agents such as radiation and hydrostatic pressure disrupt the normal structure and function of the cytoskeleton This may be an important step in the overall expression of their action It was therefore an opportune time to hold a conference to encourage the development of this area of toxicology and to suggest directions for future research Journal of the National Cancer Institute ,2002-07 Medical and Health Care Books and Serials in Print ,1986 International Review of Cytology ,1986-04-10 International Review of Cytology
